SUBSTITUTED PYRAZOLES AS p38 KINASE INHIBITORS

Cross-Reference to Related Application

This application claims priority from U.S. Provisional Application Serial No. 60/047,570 filed May 22, 1997.

Field of the Invention

This invention relates to a novel group of pyrazole compounds, compositions and methods for treating p38 kinase mediated disorders.

Background of the Invention

Mitogen-activated protein kinases (MAP) is a family of proline-directed serine/threonine kinases that activate their substrates by dual phosphorylation. The kinases are activated by a variety of signals including nutritional and osmotic stress, UV light, growth factors, endotoxin and inflammatory cytokines. The p38 MAP kinase group is a MAP family of various isoforms, including p38α, p38β and p38γ, and is responsible for phosphorylating and activating transcription factors (e.g. ATF2, CHOP and MEF2C) as well as other kinases (e.g. MAPKAP-2 and MAPKAP-3). The p38 isoforms are activated by bacterial lipopolysaccharide, physical and chemical stress and by pro-inflammatory cytokines, including tumor necrosis factor (TNF-α) and interleukin-1 (IL-1). The products of the p38 phosphorylation mediate the production of inflammatory cytokines, including TNF and IL-1, and cyclooxygenase-2.

TNF-α is a cytokine produced primarily by activated monocytes and macrophages. Excessive or unregulated TNF production has been implicated in mediating a number of diseases. Recent studies indicate that TNF has a causative role in the pathogenesis of rheumatoid

arthritis. Additional studies demonstrate that inhibition of TNF has broad application in the treatment of inflammation, inflammatory bowel disease, multiple sclerosis and asthma.

TNF has also been implicated in viral infections, such as HIV, influenza virus, and herpes virus including herpes simplex virus type-1 (HSV-1), herpes simplex virus type-2 (HSV-2), cytomegalovirus (CMV), varicella-zoster virus (VZV), Epstein-Barr virus, human herpesvirus-6 (HHV-6), human herpesvirus-7 (HHV-7), human herpesvirus-8 (HHV-8), pseudorabies and rhinotracheitis, among others.

IL-8 is another pro-inflammatory cytokine, which is produced by mononuclear cells, fibroblasts, endothelial cells, and keratinocytes, and is associated with conditions including inflammation.

IL-1 is produced by activated monocytes and macrophages and is involved in the inflammatory response. IL-1 plays a role in many pathophysiological responses including rheumatoid arthritis, fever and reduction of bone resorption.

TNF, IL-1 and IL-8 affect a wide variety of cells and tissues and are important inflammatory mediators of a wide variety of disease states and conditions. The inhibition of these cytokines by inhibition of the p38 kinase is of benefit in controlling, reducing and alleviating many of these disease states.

Various pyrazoles have previously been described. U.S. Patent No. 4,000,281, to Beiler and Binon, describes 4,5-aryl/heteroaryl substituted pyrazoles with antiviral activity against both RNA and DNA viruses such as myxoviruses, adenoviruses, rhinoviruses, and various viruses of the herpes group. WO 92/19615, published November 12, 1992, describes pyrazoles as novel fungicides. U. S. Patent No. 3,984,431, to Cueremy and Renault, describes derivatives of pyrazole-5-acetic acid as having anti-inflammatory activity. Specifically, [1-

isobutyl-3,4-diphenyl-1H-pyrazol-5-yl]acetic acid is described. U. S. Patent No. 3,245,093 to Hinsgen et al; describes a process for preparing pyrazoles. WO 83/00330, published February 3, 1983, describes a new process for the preparation of diphenyl-3,4-methyl-5-pyrazole derivatives. WO 95/06036, published March 2, 1995, describes a process for preparing pyrazole derivatives. US patent 5,589,439, to T. Goto, et al., describes tetrazole derivatives and their use as herbicides. EP 515,041 describes pyrimidyl substituted pyrazole derivatives as novel agricultural fungicides. Japanese Patent 4,145,081 describes pyrazolecarboxylic acid derivatives as herbicides. Japanese Patent 5,345,772 describes novel pyrazole derivatives as inhibiting acetylcholinesterase.

Pyrazoles have been described for use in the treatment of inflammation. Japanese Patent 5,017,470 describes synthesis of pyrazole derivatives as anti-inflammatory, anti-rheumatic, anti-bacterial and anti-viral drugs. EP 115640, published Dec 30, 1983, describes 4-imidazolyl-pyrazole derivatives as inhibitors of thromboxane synthesis. 3-(4-Isopropyl-1-methylcyclohex-1-yl)-4-(imidazol-1-yl)-1H-pyrazole is specifically described. WO 97/01551, published Jan 16, 1997, describes pyrazole compounds as adenosine antagonists. 4-(3-Oxo-2,3-dihydropyridazin-6-yl)-3-phenylpyrazole is specifically described. U.S. Patent No. 5,134,142, to Matsuo et al. describes 1,5-diaryl pyrazoles as having anti-inflammatory activity.

U.S. Patent No. 5,559,137 to Adams et al, describes novel pyrazoles (1,3,4,-substituted) as inhibitors of cytokines used in the treatment of cytokine diseases. Specifically, 3-(4-fluorophenyl)-1-(4-methylsulfinylphenyl)-4-(4-pyridyl)-5H-pyrazole is described. WO 96/03385, published February 8, 1996, describes 3,4-substituted pyrazoles, as having anti-

inflammatory activity. Specifically, 4-[1-ethyl-4-(4-pyridyl)-5-trifluoromethyl-1H-pyrazol-3-yl]benzenesulfonamide is described.

The invention's pyrazolyl compounds are found to show usefulness as p38 kinase inhibitors.

As used herein, the term "TNF mediated disorder" refers to any and all disorders and disease states in which TNF plays a role, either by control of TNF itself, or by TNF causing another monokine to be released, such as but not limited to IL-1, IL-6 or IL-8. A disease state in which, for instance, IL-1 is a major component, and whose production or action, is exacerbated or secreted in response to TNF, would therefore be considered a disorder mediated by TNF.

As used herein, the term "p38 mediated disorder" refers to any and all disorders and disease states in which p38 plays a role, either by control of p38 itself, or by p38 causing another factor to be released, such as but not limited to IL-1, IL-6 or IL-8. A disease state in which, for instance, IL-1 is a major component, and whose production or action, is exacerbated or secreted in response to p38, would therefore be considered a disorder mediated by p38.

As TNF-β has close structural homology with TNF-α (also known as cachectin) and since each induces similar biologic responses and binds to the same cellular receptor, the synthesis of both TNF-α and TNF-β are inhibited by the compounds of the present invention and thus are herein referred to collectively as "TNF" unless

specifically delineated otherwise.

The heterosubstituted hydrocarbon moieties described

herein are hydrocarbon moieties which are substituted with at least one atom other than carbon, including moieties in which a carbon chain atom is substituted with a hetero atom such as nitrogen, oxygen, sulfur, or a halogen atom. These substituents include lower alkoxy such as methoxy, ethoxy, butoxy; halogen such as chloro or fluoro; ethers; acetals; ketals; esters; heterocyclyl such as furyl or thienyl; alkanoxy; hydroxy; protected hydroxy; acyl; acyloxy; nitro; cyano; amino; and amido.

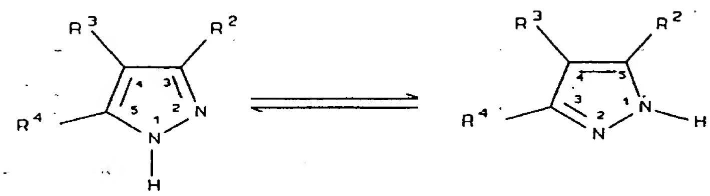
The present invention comprises the tautomeric forms of compounds of Formulas I and IX. As illustrated below, the pyrazoles of Formula I and I′ are magnetically and structurally equivalent because of the prototropic

tautomeric nature of the hydrogen:



(I) (I')

The present invention also comprises compounds of Formula I, IX, X and XI having one or more asymmetric carbons. It is known to those skilled in the art that those pyrazoles of the present invention having asymmetric carbon atoms may exist in diastereomeric, racemic, or optically active forms. All of these forms are contemplated within the scope of this invention. More specifically, the present invention includes enantiomers, diastereomers, racemic mixtures, and other mixtures thereof.

The present invention comprises a pharmaceutical composition for the treatment of a TNF mediated disorder, a P38 kinase mediated disorder, inflammation, and/or arthritis, comprising a therapeutically-effective amount of a compound of Formula I, or a therapeutically-acceptable salt or tautomer thereof, in association with at least one pharmaceutically-acceptable carrier, adjuvant or diluent.

The present invention further encompasses substituted pyrazoles that specifically bind to the ATP binding site of p38 kinase. Without being held to a particular theory, applicants hypothesize that these substituted pyrazoles interact with p38 kinase as set forth below. As the substituent at the 3-position of the pyrazole ring approaches the ATP binding site of p38

kinase, a hydrophobic cavity in the p38 kinase forms around the 3-position substitutent at the binding site. This hydrophobic cavity is believed to form as the 3-position substituent binds to a specific peptide sequence of the enzyme. In particular, it is believed to bind to the sidechains of Lys_{52}, Glu_{69}, Leu_{73}, Ile_{82}, Leu_{84}, Leu_{101} and the methyl group of the Thr_{103} sidechain of p38 kinase at the ATP binding site (wherein the numbering scheme corresponds to the numbering scheme conventionally used for ERK-2). Where the 3-position substituent is aryl or heteroaryl, such aryl or heteroaryl may be further substituted. It is hypothesized that such ring substituents may be beneficial in preventing hydroxylation or further metabolism of the ring.

The substituent at the 4-position of the pyrazole ring is one that is a partial mimic of the adenine ring of ATP, although it may be further elaborated. Preferably, it is a planar substituent terminated by a suitable hydrogen bond acceptor functionality. It is hypothesized that this acceptor hydrogen bonds to the backbone N-H of the Met_{106} residue while one edge of this substituent is in contact with bulk solvent.

Substitution at the 5-position of the pyrazole ring is well tolerated and can provide increased potency and selectivity. It is hypothesized that such substituents extend out in the direction of the bulk solvent and that suitable polar functionality placed at its terminus can interact with the sidechain of Asp^{109}, leading to increased potency and selectivity.

Similarly, substitution on the nitrogen atom at the 1- or 2-position of the pyrazole ring is well tolerated and can provide increased potency. It is hypothesized that a hydrogen substituent attached to one of the ring nitrogen atoms is hydrogen bonded to Asp_{165}. Preferably, the nitrogen atom at the 2-position is double bonded to the carbon atom at the 3-position of the pyrazole while

the nitrogen atom at the 1-position of the pyrazole is available for substitution with hydrogen or other substituents.

More preferably, these substituents each have a molecular weight less than about less than about 250 atomic mass units. Still more preferably, these substituents have a combined molecular weight less than about 360 atomic mass units.

A class of substituted pyrazoles of particular interest consists of those compounds having the formula:

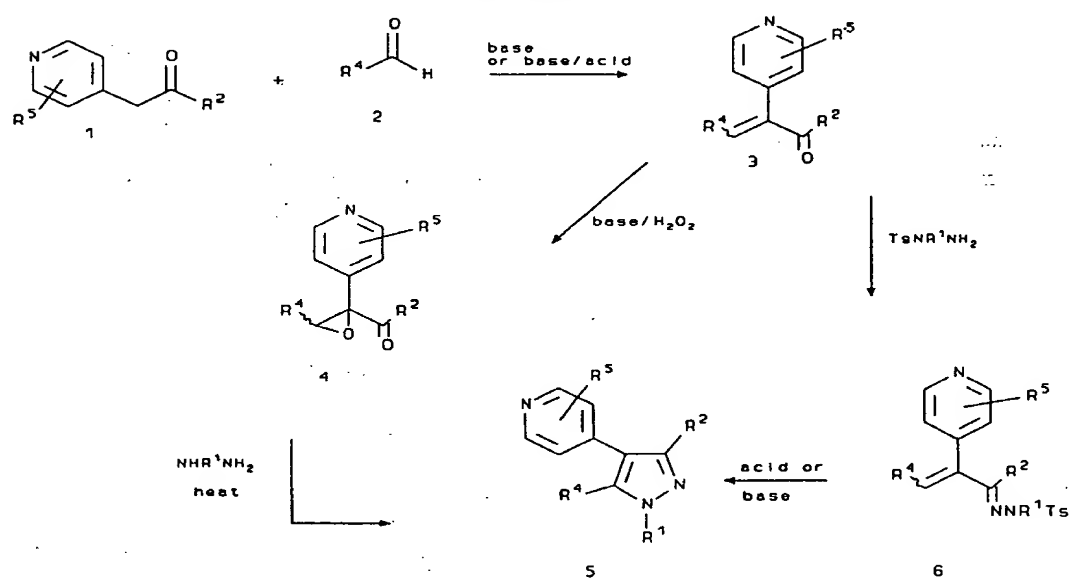
Also included in the family of compounds of Formula I are the pharmaceutically-acceptable salts thereof. The term "pharmaceutically-acceptable salts" embraces salts commonly used to form alkali metal salts and to form addition salts of free acids or free bases. The nature of the salt is not critical, provided that it is pharmaceutically-acceptable. Suitable pharmaceutically-acceptable acid addition salts of compounds of Formula I may be prepared from an inorganic acid or from an organic acid. Examples of such inorganic acids are hydrochloric, hydrobromic, hydroiodic, nitric, carbonic, sulfuric and phosphoric acid. Appropriate organic acids may be selected from aliphatic, cycloaliphatic, aromatic, araliphatic, heterocyclyl, carboxylic and sulfonic classes of organic acids, example of which are formic, acetic, propionic, succinic, glycolic, gluconic, lactic, malic, tartaric, citric, ascorbic, glucuronic, maleic, fumaric, pyruvic, aspartic, glutamic, benzoic, anthranilic, mesylic, stearic, salicylic, *p*-hydroxybenzoic, phenylacetic, mandelic, embonic (pamoic), methanesulfonic, ethanesulfonic, benzenesulfonic, pantothenic, toluenesulfonic, 2-hydroxyethanesulfonic, sulfanilic, cyclohexylaminosulfonic, algenic, β-hydroxybutyric, galactaric and galacturonic acid. Suitable pharmaceutically-acceptable base addition salts of compounds of Formula I include metallic salts and organic salts. More preferred metallic salts include, but are not limited to appropriate alkali metal (group Ia) salts, alkaline earth metal (group IIa) salts and other physiological acceptable metals. Such salts can be made from aluminum, calcium, lithium, magnesium, potassium, sodium and zinc. Preferred organic salts can be made from tertiary amines and quaternary ammonium salts, including in part, tromethamine, diethylamine, N,N'-dibenzylethylenediamine, chloroprocaine, choline, diethanolamine, ethylenediamine, meglumine (N-

methylglucamine) and procaine. All of these salts may be prepared by conventional means from the corresponding compound of Formulas I-III by reacting, for example, the appropriate acid or base with the compound of Formulas I-III.

General Synthetic Procedures

The compounds of the invention can be prepared according to the following procedures of Schemes I-XVIII wherein R^1, R^2, R^3, R^4, R^5 and Ar^1 are as previously defined for the compounds of Formula I, IX, X and XI except where expressly noted.

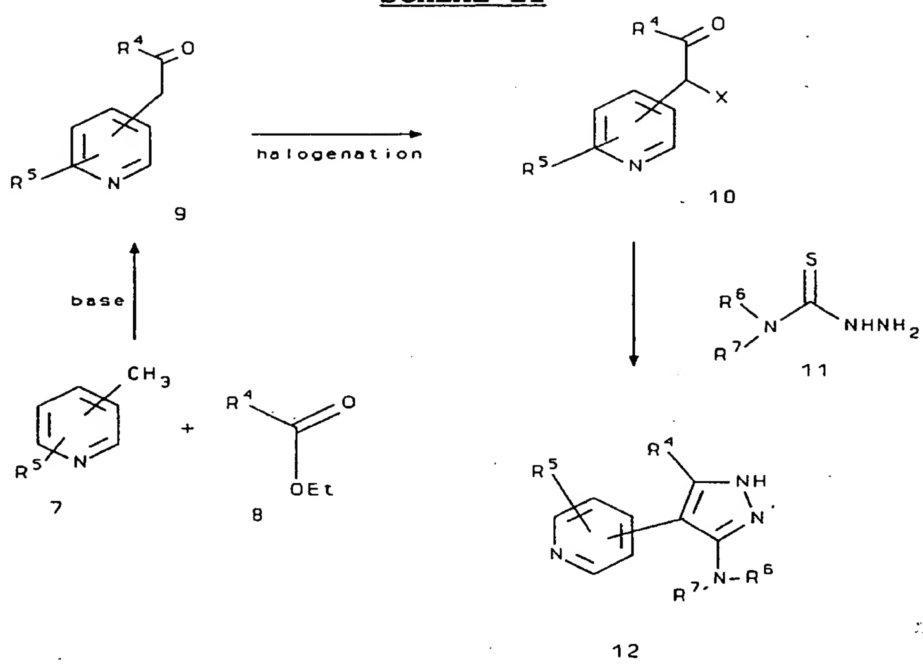
SCHEME I



Scheme I shows the synthesis of pyrazole 5 by two

routes. Condensation of the pyridylmethyl ketone **1** with aldehyde **2** in the presence of a base, such as piperidine, in a solvent, such as toluene or benzene, either in the absence or the presence of acetic acid at reflux, provides the α,β-unsaturated ketone **3**. In route 1, ketone **3** is first converted to epoxide **4**, such as by treatment with hydrogen peroxide solution at room temperature, in the presence of base such as sodium hydroxide. Treatment of epoxide **4** with hydrazine in ethanol or other suitable solvent at a temperature ranging up to reflux, yields pyrazole **5**. In route 2, ketone **3** is condensed directly with tosyl hydrazide in the presence of an acid such as acetic acid, at reflux, to provide pyrazole **5**. Alternatively, the intermediate tosyl hydrazone **6** may be isolated, conversion of it to pyrazole **5** is effected by treatment with a base, such as potassium hydroxide, in a suitable solvent, such as ethylene glycol, at a temperature ranging from 25 °C up to 150 °C.

SCHEME II

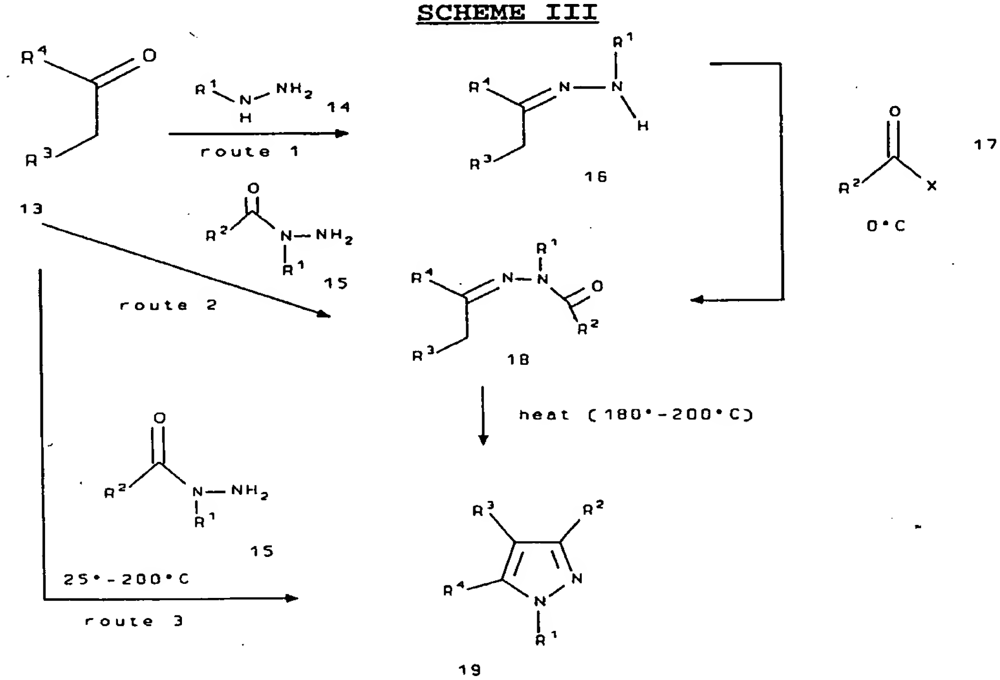


Scheme II shows the synthesis of pyrazole **12** of the present invention. The treatment of pyridine derivative **7** with ester **8** in the presence of a base, such as sodium bis(trimethylsilyl)amide, in a suitable solvent, such as tetrahydrofuran, gives ketone **9**. Treatment of ketone **9** or a hydrohalide salt of ketone **9** with a halogenating agent, such as bromine, N-bromosuccinimide or N-chlorosuccinimide, in suitable solvents, such as acetic acid, methylene chloride, methanol, or combinations thereof, forms the α-halogenated ketone **10** (wherein X is halo). Examples of suitable hydrohalide salts include the hydrochloride and hydrobromide salts. Reaction of haloketone **10** with thiosemicarbazide **11** (where R^6 and R^7 can be hyrido, lower alkyl, phenyl, heterocyclyl and the like or where R^6 and R^7 form a heterocyclyl ring optionally containing an additional heteroatom) provides pyrazole **12**. Examples of suitable solvents for this

reaction are ethanol and dimethylformamide. The reaction may be carried out in the presence or absence of base or acid at temperatures ranging from room temperature to 100 °C.

Thiosemicarbazides which are not commercially available may be conveniently prepared by one skilled in the art by first reacting an appropriate amine with carbon disulfide in the presence of a base, followed by treatment with an alkylating agent such as methyl iodide. Treatment of the resultant alkyl dithiocarbamate with hydrazine results in the desired thiosemicarbazide. This chemistry is further described in E. Lieber and R.C. Orlowski, J. Org. Chem., Vol. 22, p. 88 (1957). An alternative approach is to add hydrazine to appropriately substituted thiocyanates as described by Y. Nomoto et al., Chem. Pharm. Bull., Vol. 39, p.86 (1991). The Lieber and Nomoto publications are incorporated herein by reference.

SCHEME III



Scheme III shows the synthesis of pyrazole **19** in more general form by three routes. In Route 1, ketone **13** is condensed with hydrazine **14** to give the substituted hydrazide **16**, which is then reacted with acyl halide or anhydride **17** at low temperature to provide acyl hydrazone **18**. Upon heating at a temperature up to 200°C, acyl hydrazone **18** is converted to pyrazole **19**. In Route 2, acyl hydrazone **18** is formed directly by reaction of ketone **13** with acyl hydrazide **15**, formed by reaction of hydrazine with a carboxylic acid ester, at room temperature. Heating acyl hydrazone **18** as above then provides pyrazole **19**. In Route 3, ketone **13** is treated with acyl hydrazide **15** at a suitable temperature, ranging from room temperature to about 200 °C, to give pyrazole **19** directly. Alternatively, this condensation may be carried out in an acidic solvent, such as acetic acid, or in a solvent containing acetic acid.

Synthetic Scheme IV describes the preparation of pyrazole **19**.

Scheme V shows the two step synthesis of the 3-substituted 4-pyridyl-5-arylpyrazoles **33** of the present invention by cyclization of hydrazone dianions with carboxylates. In step 1, the reaction of substituted pyridylmethyl ketones **31** (prepared, for example, as later described in Scheme IX) with hydrazines in the presence of solvents such as ethanol gives ketohydrazones **32**. Examples of suitable hydrazines include, but are not limited to, phenylhydrazine and p-methoxyphenylhydrazine. In step 2, the hydrazones **32** are treated with two equivalents of a base such as sodium bis(trimethylsilyl)amide in a suitable solvent such as tetrahydrofuran to generate dianions. This reaction may be carried out at temperatures of about 0 °C or lower.

In the same step, the dianions then are condensed with esters such as methyl isonicotinate, methyl cyclopropanecarboxylate, to give the desired pyrazoles **33**. It may be necessary to treat the product from this step with a dehydrating agent, such as a mineral acid, to produce the target pyrazole in some instances.

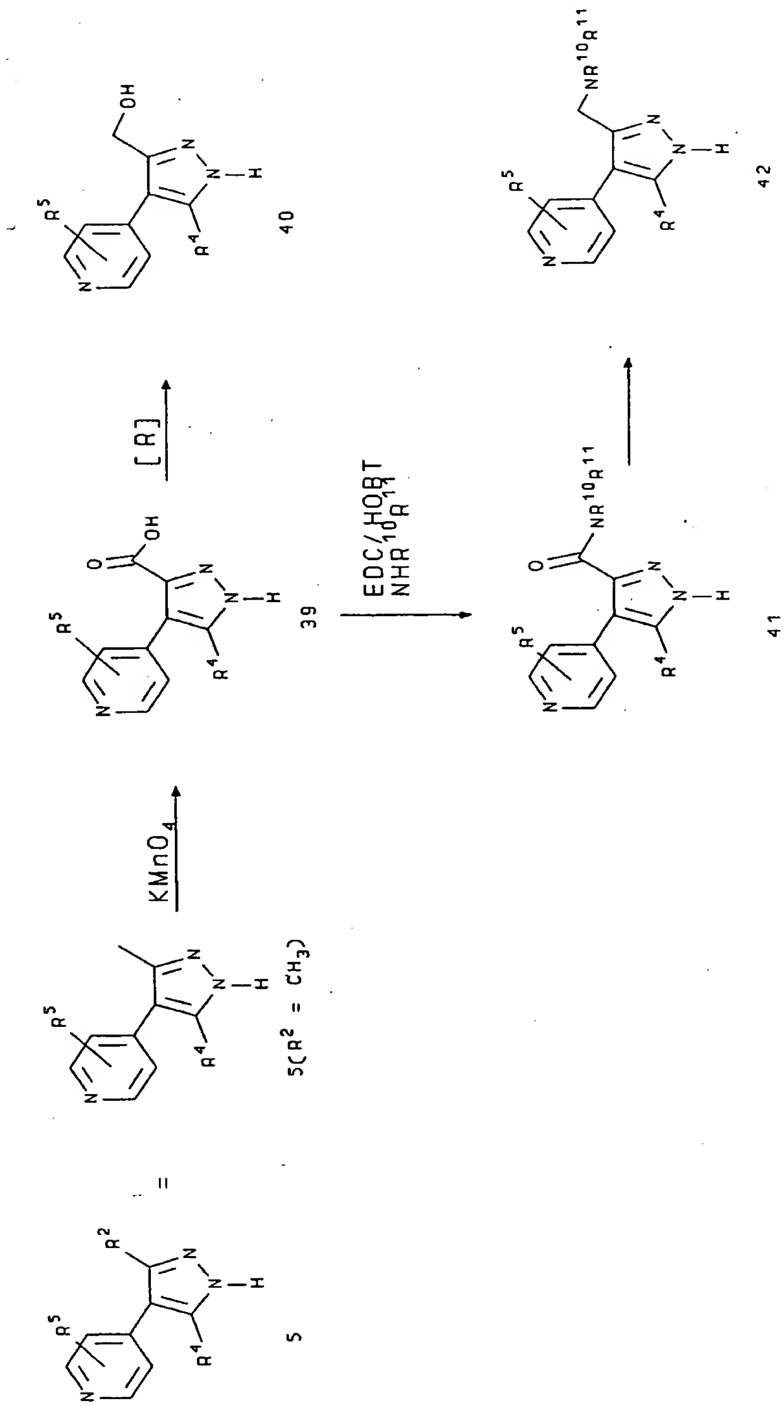
Scheme VI shows an alternative method for synthesizing pyrazoles which are unsubstituted at the 5 position of the ring. In accordance with this method, a heteroarylmethyl ketone **34** is synthesized by first treating a heteroarylmethane with a strong base such as lithium hexamethyldisilazide or lithium diisopropylamide. Examples of suitable heteroarylmethanes are 4-methylpyridine, 4-methylpyrimidine, 2,4-dimethylpyridine, 2-chloro-4-methylpyrimidine, 2-chloro-4-methylpyridine and 2-fluoro-4-methylpyridine. The resulting heteroarylmethyl lithium species is then reacted with a substituted benzoate ester to produce ketone **34**. Examples of suitable benzoate esters are methyl and ethyl p-fluorobenzoate and ethyl and methyl p-chlorobenzoate. Ketone **34** is converted to the aminomethylene derivative **35** by reaction with an aminomethylenating agent such as dimethylformamide dimethyl acetal or tert-butoxybis(dimethylamino)methane. Ketone **35** is converted to pyrazole **36** by treatment with hydrazine.

A modification of this synthetic route serves to regioselectively synthesize pyrazole **38** which contains a substituted nitrogen at position 1 of the ring. Ketone **34** is first converted to hydrazone **37** by reaction with the appropriate substituted hydrazine. Examples of suitable hydrazines are N-methylhydrazine and N-(2-hydroxyethyl)hydrazine. Reaction of hydrazone **37** with an aminomethylenating agent produces pyrazole **38**. Examples of suitable aminomethylenating agents include dimethylformamide dimethyl acetal and tert-butoxybis(dimethylamino)methane.

In cases where the R^3 substituent of pyrazoles **36** and **38** bears a leaving group such as a displaceable halogen, subsequent treatment with an amine produces an amino-substituted heteroaromatic derivative. Examples of such amines include benzylamine, cyclopropylamine and ammonia.

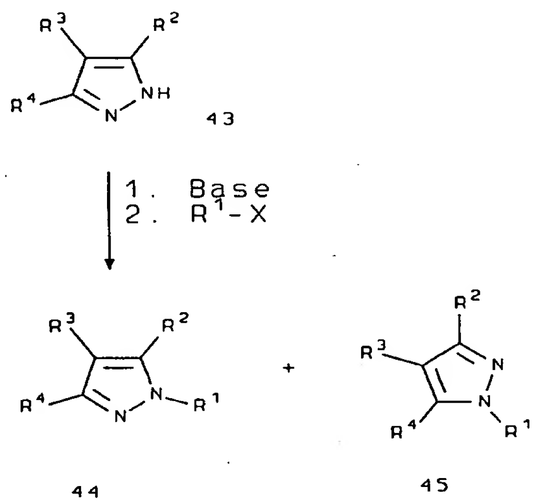
The leaving group may also be replaced with other nucleophiles such as mercaptides and alkoxides. Examples of substitutable R^3 groups include, but are not limited to, 2-chloropyridinyl and 2-bromopyridinyl groups.

SCHEME VII



Scheme VII describes the preparation of derivatives from pyrazole **5** (prepared in accordance with Scheme I) when $R^2 = CH_3$. Oxidation of pyrazole **5** gives carboxylic acid **39**, which is then reduced to hydroxymethyl compound **40**, or coupled with amine $NR^{10}R^{11}$ (wherein R^{10} and R^{11} are independently selected, for example, from hydrogen, alkyl and aryl, or together with the nitrogen atom to which they are attached form a 4-8 membered ring that may contain one or more additional heteroatoms selected from oxygen, nitrogen or sulfur) to form amide **41** followed by reduction to generate amine derivative **42**.

SCHEME VIII



Scheme VIII illustrates the synthesis of pyrazoles **44** and **45** from pyrazole **43**. The alkylation of the ring nitrogen atoms of pyrazole **43** can be accomplished using conventional techniques. Treatment of pyrazole **43** with an appropriate base (for example, sodium hydride) followed by treatment with an alkyl halide (for example, CH_3I) yields a mixture of isomers **44** and **45**.

Scheme IX illustrates the synthesis of 3-aryl-4-pyridyl-pyrazoles of the present invention. Benzoate **46** is reacted with pyridine **47** in the presence of a strong base, such as an alkali metal hexamethyldisilazide (preferably sodium hexamethyldisilazide or lithium hexamethyldisilazide), in a suitable solvent, such as tetrahydrofuran, to give desoxybenzoin **48**. Desoxybenzoin **48** is then converted to ketone **49** by treatment with an excess of dimethylformamide dimethyl acetal. Ketone **49** is then reacted with hydrazine hydrate in a suitable solvent such as ethanol to yield pyrazole **50**. In Scheme IX, R^{12} represents one or more radicals independently selected from the optional substituents previously defined for R^4. Preferably, R^{12} is hydrogen, alkyl, halo, trifluoromethyl, methoxy or cyano, or represents methylenedioxy.

The 3-aryl-4-pyrimidinyl-pyrazoles of the present invention can be synthesized in the manner of Scheme IX by replacing pyridine **47** with the corresponding pyrimidine. In a similar manner, Schemes X through XVII can be employed to synthesize 3-aryl-4-pyrimidinyl-pyrimidines corresponding to the 3-aryl-4-pyrimidinyl-pyrazoles shown in those schemes.

SCHEME X

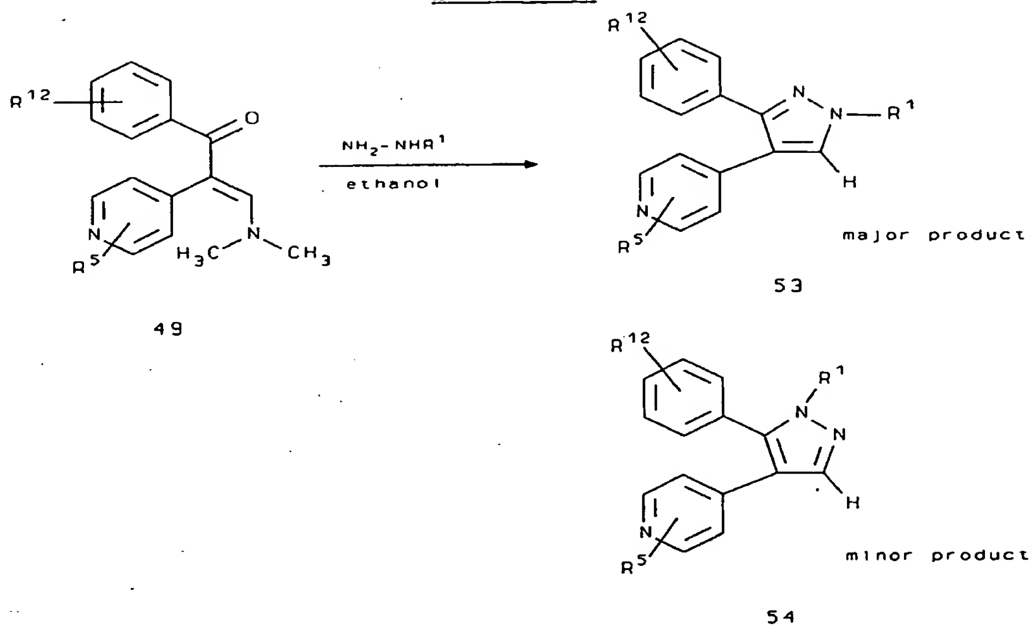
51

52

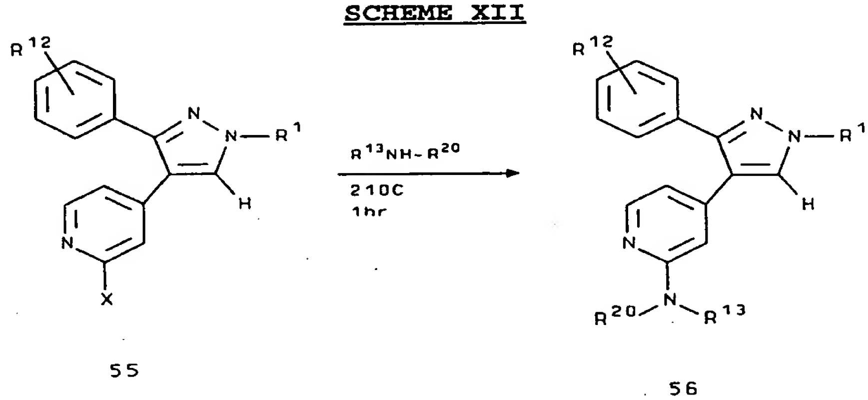
Scheme X illustrates one variation of Scheme IX that can be used to synthesize 3-aryl-4-pyridyl-pyrazoles that are further substituted on the nitrogen atom at position 1 of the pyrazole ring. If desoxybenzoin **48** (prepared in accordance with Scheme IX) instead is first converted to hydrazone **51** by treatment with hydrazine and hydrazone **51** is then treated with dimethylformamide dimethyl acetal, then the resulting product is pyrazole **52**.

Schemes XI through XVIII illustrate further modifications that can be made to Scheme IX to synthesize other 3-aryl-4-pyridyl-pyrazoles having alternative substituents.

SCHEME XI



SCHEME XII



In Scheme XII, X is chloro, fluoro or bromo; R^{13} is, for example, hydrogen, alkyl, phenyl, aralkyl, heteroarylalkyl, amino or alkylamino; and R_{20} is, for example, hydrogen or alkyl.

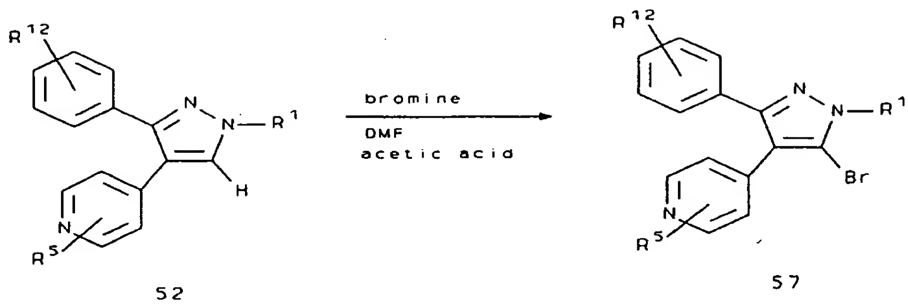
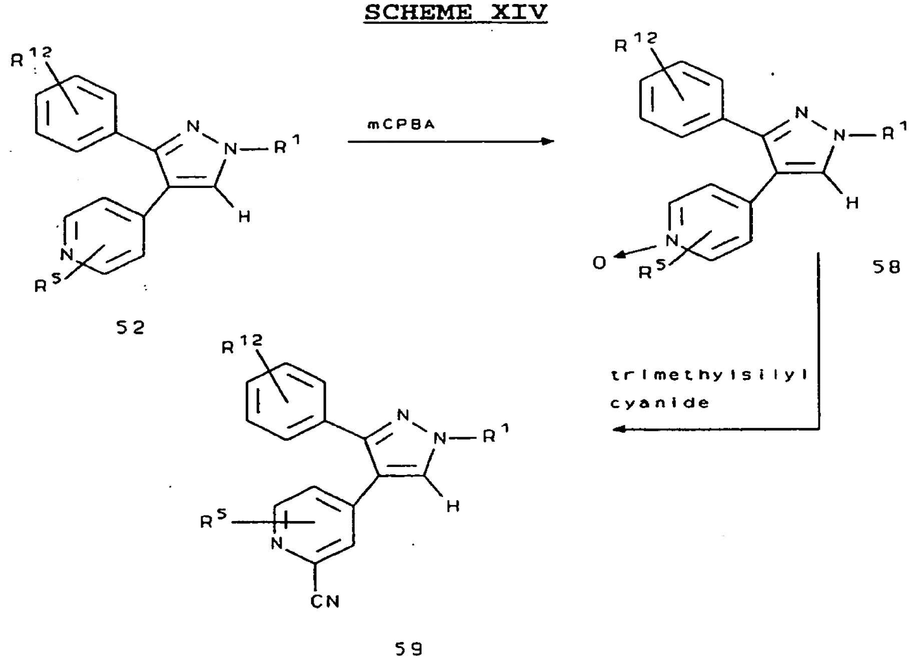
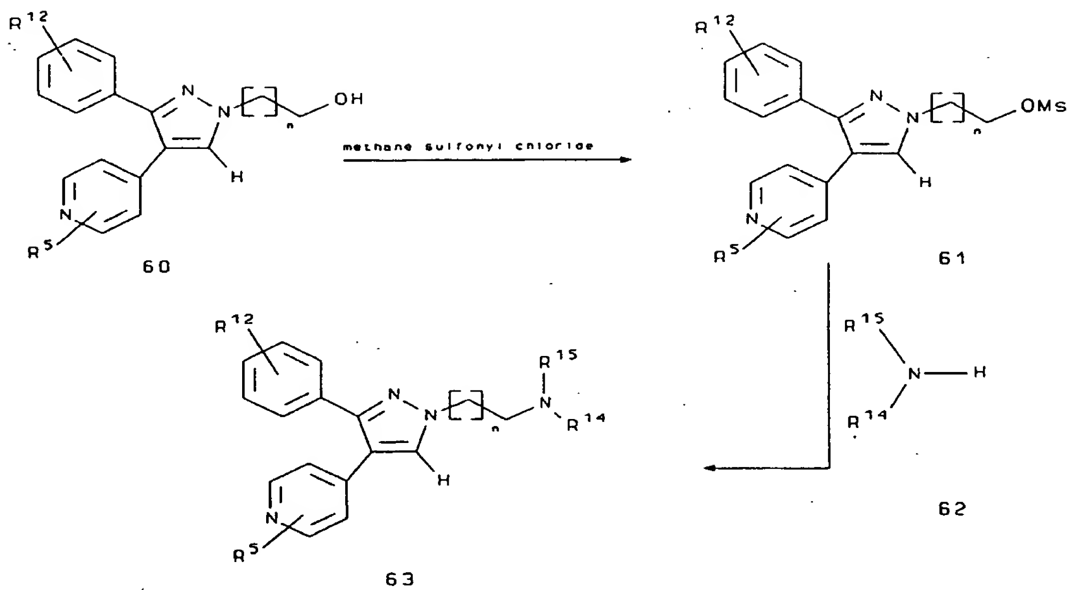


SCHEME XIV

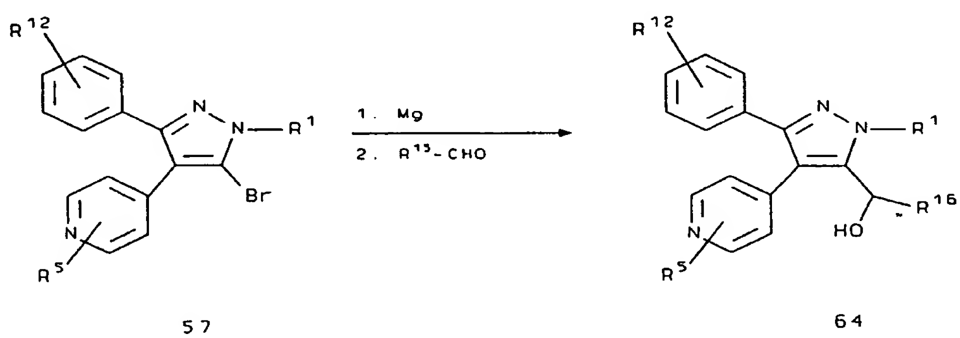


SCHEME XV



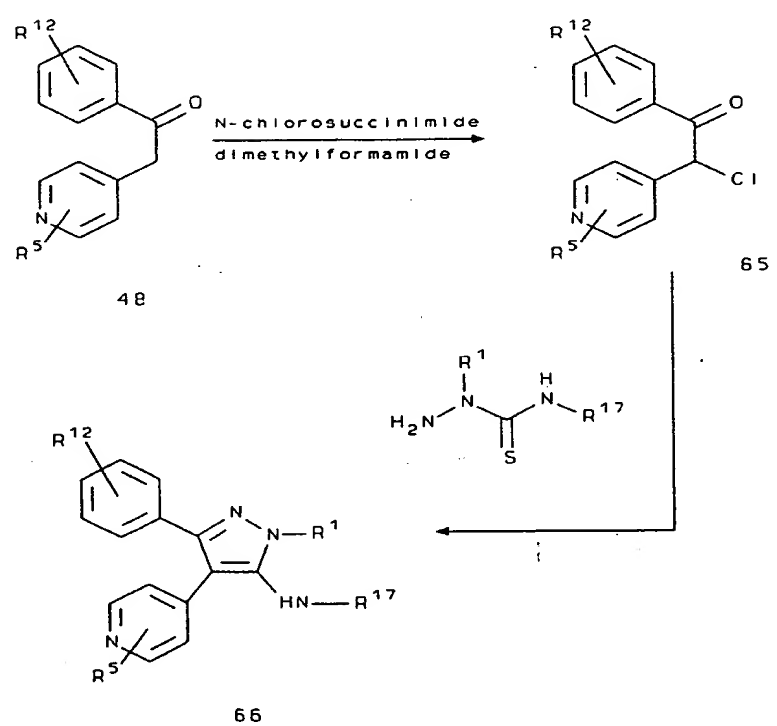
In Scheme XV, n is 1, 2, 3, 4 or 5; and R^{14} and R^{15} are independently selected from, for example, hydrogen, alkyl or aryl, or together with the nitrogen atom to which they are attached form a 4-7 membered ring that may contain one or more additional heteroatoms selected from oxygen, nitrogen or sulfur.

SCHEME XVI



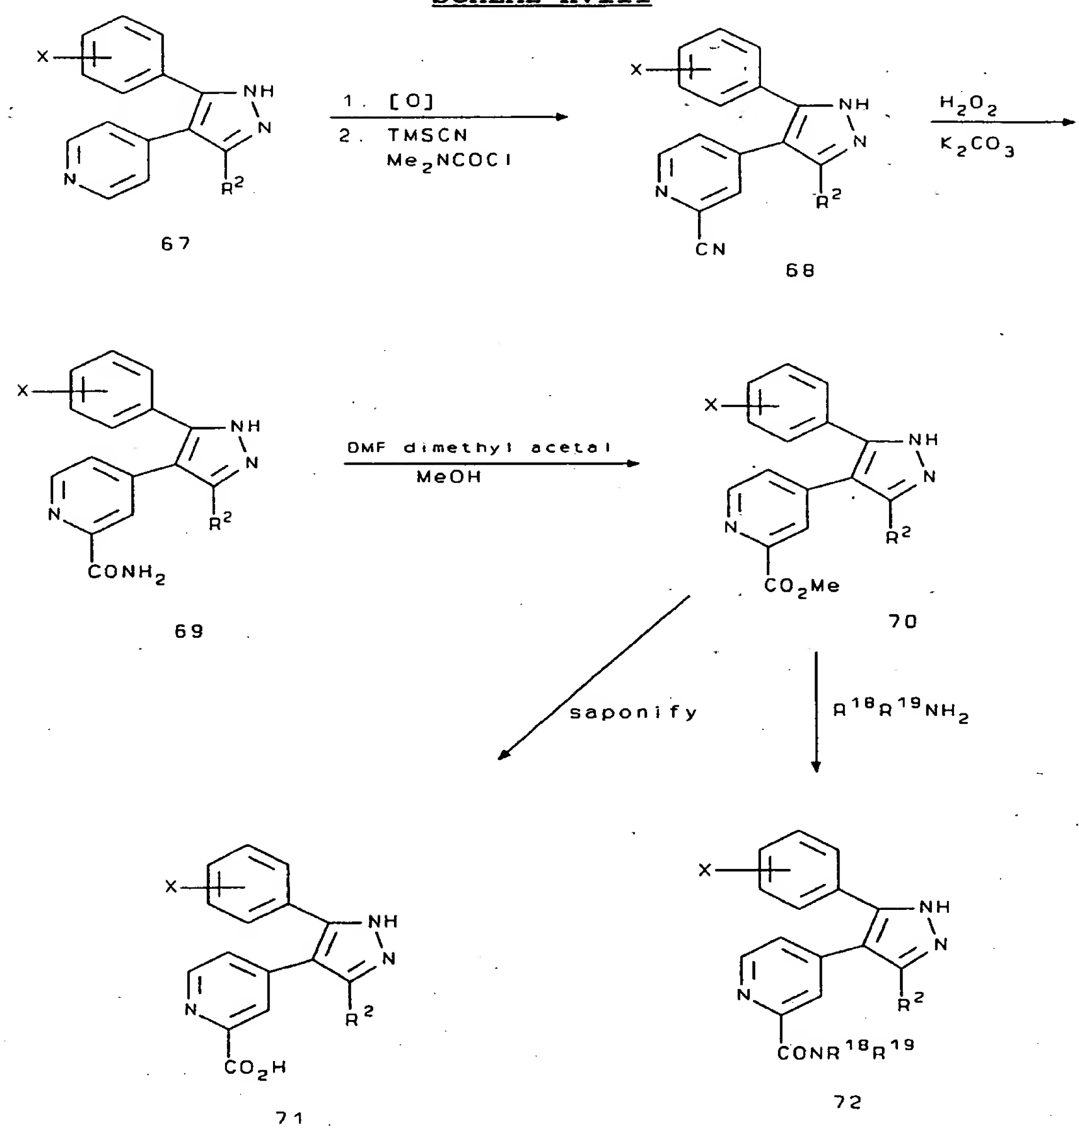
In Scheme XVI, R^{16} is selected, for example, from hydrogen, alkyl and phenyl.

SCHEME XVII



In Scheme XVII, R^{17} is selected, for example, from alkyl, phenylalkyl and heterocyclylalkyl.

SCHEME XVIII



Compounds wherein the 2-position of the pyridine ring is substituted by a carboxyl group or a carboxyl derivative may be synthesized according to the procedures outline in Scheme XVIII. The starting pyridyl pyrazole **67** is converted to the 2-cyano derivative **68** by first

conversion to its pyridine N-oxide by reaction with an oxidizing agent such as m-chloroperoxybenzoic acid. Treatment of the pyridine N-oxide with trimethylsilyl cyanide followed by dimethylcarbamoyl chloride produces the 2-cyano compound **68**. Compound **68** is converted to its carboxamide **69** by reaction with hydrogen peroxide in the presence of a suitable base. Examples of suitable bases include potassium carbonate and potassium bicarbonate. Carboxamide **69** is converted to its methyl ester **70** by reaction with dimethylformamide dimethyl acetal in methanol. The ester **70** is converted to its carboxylic acid **71** by saponification. Typical saponification conditions include reaction with a base such as sodium hydroxide or potassium hydroxide in a suitable solvent such as ethanol or ethanol and water or methanol and water or the like. Ester **70** is also convertible to substituted amide **72** by treatment with a desired amine, such as methylamine at a suitable temperature. Temperatures may range from room temperature to 180°C. In Scheme XVIII, R^{18} and R^{19} are independently selected, for example, from hydrogen, alkyl and aryl, or together with the nitrogen atom to which they are attached form a 4-8 membered ring that may contain one or more additional heteroatoms selected from oxygen, nitrogen or sulfur.

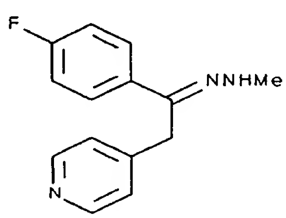
Step 1: Preparation of 1-(4-fluorophenyl)-2-(4-pyridinyl)ethanone methylhydrazone



1-(4-fluorophenyl)-2-(4-pyridinyl)ethanone methylhydrazone

To a solution of 4-fluorobenzoyl-4'-pyridinyl methane (8.60 g, 0.04 mol) and methyl hydrazine (2.14 g, 0.044 mol) in 50 mL of ethanol was added two drops of concentrated sulfuric acid. A mixture of 4-[3-(4-fluorophenyl)-5-methyl-1H-pyrazol-4-yl]pyridine prepared as set forth in Example A-4 (5.83 g, 24.0909 mmol) and potassium permanganate (7.6916 g, 48.1818 mmol) in water (7.5 ml) and tert-butanol (10 ml) was heated at reflux for 6 hours (or until all the potassium permanganate was consumed). The mixture was then stirred at room temperature overnight and then diluted with water (150 ml). Manganese dioxide was removed from the mixture by filtration. The filtrate was extracted with ethyl acetate to remove unreacted starting material. The aqueous layer was acidified with 1N HCl to increase the pH to about 6. 5-(4-fluorophenyl)-4-(4-pyridinyl)-1H-pyrazole-3-methanol

To a suspension of 5-(4-fluorophenyl)-4-(4-pyridinyl)-1H-pyrazole-3-carboxylic acid, monohydrate prepared in accordance with Example A-200 (0.526 g, 2.0 mmol) in dry THF (15 ml) at reflux under nitrogen, a solution of 1N lithium aluminum hydride in THF (4.0 ml,

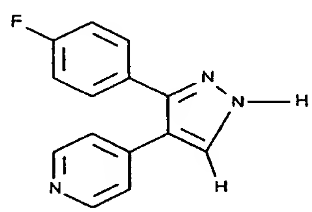
The combined filtrates were concentrated under reduced pressure. The resulting residue was taken into ethyl acetate, washed with water and brine, dried over $MgSO_4$ to give a crude product (0.45 g). Recrystallization of the crude product from methanol gave 5-(4-fluorophenyl)-4-(4-pyridinyl)-1H-pyrazole-3-methanol (0.2808 g, 56.5%). DSC: 260.26 °C; Anal. The compounds of Examples A-208 and A-209 were prepared in accordance with the chemistry described above (particularly in Scheme IX):

Example A-208



4-[3-(4-fluorophenyl)-1H-pyrazol-4-yl]pyridine

Step 1: Preparation of 4-fluorobenzoyl-4'-pyridyl methane

To a mixture of 4-picoline (32.6 g, 0.35 moles) and ethyl-4-fluorobenzoate (50.45g, 0.3 moles), maintained at 20 °C, was added lithium bis(trimethylsilylamide) (600 mL (1M)) in a steady but rapid stream so as to maintain ambient temperature. The initial yellow solution turned into a suspension which was then stirred for an additional 2 hours. Toluene (250 mL) was added and the mixture cooled to 0 °C. The reaction mixture was quenched with concentrated HCl at 0 °C to lower the pH to about 7. The organic layer was separated and the aqueous layer re-extracted with of toluene (100 mL). The organic layer was dried (sodium sulfate) and concentrated, to furnish a yellow solid which on trituration with hexanes (200 mL) provided the pure desoxybenzoin, 4-

fluorobenzoyl-4'-pyridyl methane, in 90% yield (58g). ^1H NMR was consistent with the proposed structure.

Step 2:

To a suspension of the desoxybenzoin prepared in step 1 (30g, 0.14 moles) in tetrahydrofuran (50 mL) was added dimethylformamide dimethyl acetal (50 mL) and the mixture stirred at ambient temperature for two days. The solution was then concentrated to dryness and the solid paste obtained was triturated with hexanes (150 mL) to furnish a yellow solid which was of sufficient purity (as determined by NMR) and was used for the next step without additional purification. Yield: 33.9 g (90%). ^1H NMR was consistent with the proposed structure.

Step 3:

The vinyl amine prepared in step 2 (33.9g, 0.1255 moles) was dissolved in 125 mL of ethanol and cooled to 0 °C. Hydrazine hydrate (8.0g of anhydrous or 16.0g. of hydrate, 0.25 moles) was then added in one portion. The mixture was stirred well and allowed to warm up to ambient temperature for a total reaction time of 3 hours. The mixture was concentrated and taken up in 200 mL of chloroform. After washing with water (100 mL), the organic layer was extracted with 150 mL of 10% HCl. The water layer was then treated with 0.5 g of activated charcoal at 70 °C for 10 minutes, filtered through celite and neutralized cautiously to pH 7 - 8 with vigorous stirring and cooling (20% sodium hydroxide was used). The fine off-white precipitate was filtered and dried to give 4-[3-(4-fluorophenyl)-1H-pyrazol-4-yl]pyridine. Yield: 27.3g. (91%). Mass spectrum: m/z = 240. ^1H NMR was consistent with the proposed structure. Anal. calc'd for $C_{14}H_{10}FN_3$: C, 70.28; H, 4.21; N, 17.56. Found: C, 70.11; H, 4.33; N, 17.61.

4-[3-(2-chlorophenyl)-1H-pyrazol-4-yl]pyridine

This compound was prepared by the same procedure described for Example A-208 using the corresponding starting reagents.

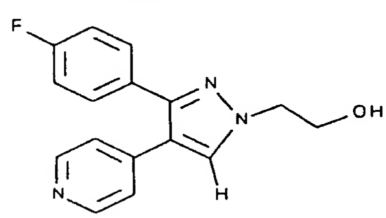
The compounds of Examples A-210 and A-211 illustrate were prepared in accordance with the chemistry described above (particularly in Scheme X):

Example A-210



3-(4-fluorophenyl)-4-(4-pyridinyl)-1H-pyrazole-1-ethanol

The desoxybenzoin prepared in step 1 of Example A-208, 4-fluorobenzoyl-4'-pyridyl methane, (12.7g, 0.059 moles) was mixed with 90% hydroxyethyl hydrazine (5.3g, 0.062 moles) in 30 mL of ethanol containing 0.5 mL of acetic acid in a 500 mL Erlenmeyer flask. After gentle boiling (1 hour), a small sample was evacuated at high vacuum and examined by ^1H NMR to confirm completion of hydrazone formation. On cooling to ambient temperature, the reaction mass solidified to a yellow cake. DMF dimethylacetal (36 mL, 0.27 moles) was then added and the mixture heated to 80C for 10min, at which point all the solids dissolved and a clear yellow viscous solution was obtained. The reaction mixture was immediately allowed to cool slowly to 25 °C, and water (20 mL) was added dropwise with stirring, at which point a cloudy yellow oily suspension was obtained. The solution was now warmed to approximately 50-60 °C, whereupon the solution turned clear yellow. Slow cooling to ambient temperature with stirring (a crystal seed if available speeds up the process) results in a copious formation of crystals. Suction filtration followed by washing with 10% ethanol-water (50 mL), followed by drying, furnishes 3-(4-fluorophenyl)-4-(4-pyridinyl)-1H-pyrazole-1-ethanol as a light yellow crystalline solid. Re-heating the filtrate to clarity as before, followed by cooling, yields additional product. The third and fourth recovery from the mother liquor on standing overnight furnishes the remaining 3-(4-fluorophenyl)-4-(4-pyridinyl)-1H-pyrazole-1-ethanol. Total yield: {12.3 + 3.3 + 0.4 + 0.4} = 16.4g. (97.6%). Mass spectrum, m/z = 284. ^1H NMR was consistent with the proposed structure. The compound of Example A-212 was prepared in accordance with the chemistry of Scheme XI:

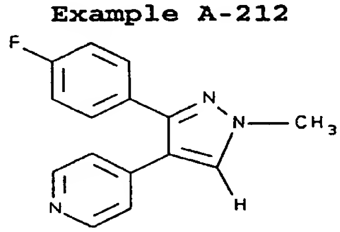
Example A-212



4-[3-(4-fluorophenyl)-1-methyl-1H-pyrazol-4-yl]pyridine

The vinyl amine prepared in Step 2 of Example A-208 (5.0g, 0.0185 moles) was taken up in ethanol (75mL) and cooled to 0 °C. Methyl hydrazine (1.7g, 0.037 moles) in ethanol (75mL) was added in one portion while maintaining the temperature at 0 to 10 °C. After 3 hours at ambient temperature the solvent was removed and the residue taken up in methylene chloride (150 mL) and water (100 mL). The organic layer was separated, dried and concentrated to provide the crude regio-isomeric mixture as a light tan colored solid (80:20 by NMR in favor of the title compound). The crude isomeric mixture was taken up in 10% HCl (100 mL) and washed with methylene chloride (100

mL) and the water layer treated with activated charcoal (0.5g). After filtration through Celite, the solution was neutralized with sodium hydroxide (20%) to pH 8 with good stirring and cooling. The cream colored precipitate was filtered, washed with water and dried. Example A-299

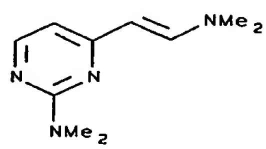
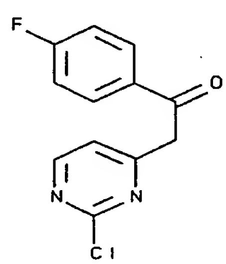
2-Chloro-4-[3-(4-fluorophenyl)-1H-pyrazol-4-yl]pyrimidine

Step 1:



A mixture of 2,6-dichloro-4-methylpyrimidine (5.0 g, 0.031 mol), triethylamine (6.23 g, 0.062 mol) and catalytic amount of 5% Pd/C in 100 mL of THF was hydrogenated on a Parr apparatus under 40 psi at room temperature. After 0.5 hour, the catalyst was filtered and the filtrate was concentrated. The crude was purified by chromatography on silica gel (ethyl acetate/hexane, 3:7) to give 2.36 g of product as a pale yellow crystal (50% yield); mp: 47-49 °C.

<u>Step 2: Preparation of 2-(2-chloro-4-pyrimidinyl)-1-(4-fluorophenyl)ethanone</u>

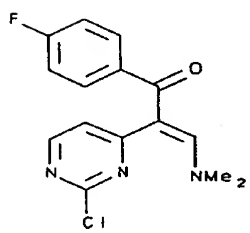


2-(2-chloro-4-pyrimidinyl)-1-(4-fluorophenyl)ethanone

To a solution of lithium diisopropylamide (generated from BuLi (0.045 mol) and diisopropylamine (0.048 mol) in THF) at -78 °C was added a solution of the compound prepared in step 1 (5.5 g, 0.037 mol) in THF slowly over 30 minutes. After 1 hour, a solution of ethyl 4-fluorobenzoate (7.62 g, 0,045 mol) in THF was added and

the reaction mixture was stirred overnight and allowed to warm up to room temperature. Water was added and the aqueous phase was extracted with ethyl acetate. Organic layer was washed with brine, dried over magnesium sulfate and filtered. The filtrate was concentrated and the crude product purified by chromatography on silica gel (ethyl acetate/hexane, 3:7) to give 4.78 g of a yellow solid (51% yield), mp: 112-113 °C.

Step 3: Preparation of (E)-2-(2-chloro-4-pyrimidinyl)-3-(dimethylamino)-1-(4-fluorophenyl)-2-propen-1-one



(E)-2-(2-chloro-4-pyrimidinyl)-3-(dimethylamino)-1-(4-fluorophenyl)-2-propen-1-one

A mixture of the compound prepared in step 2 (4.7 g, 0.017 mol) in 100 mL of dimethylformamide dimethyl acetal was stirred at room temperature overnight. Excess dimethylformamide dimethyl acetal was removed under vacuum to give 4.5 g of crude product as a thick brown oil, which was used without further purification.

Step 4: Preparation of 2-chloro-4-[3-(4-fluorophenyl)-1H-pyrazol-4-yl]pyrimidine

A solution of the compound prepared in step 3 (4.4 g) and hydrazine hydrate (0.82 g, 0.014 mol) was stirred at room temperature for 6 hours. The yellow precipitate was collected by filtration and air-dried to give 1.85 g of 2-chloro-4-[3-(4-fluorophenyl)-1H-pyrazol-4-

yl]pyrimidine as a yellow solid, mp: 204-205 °C; Anal. Calc'd for $C_{13}H_8ClFN_4$: C, 56.84; H, 2.94; N, 20.40; Cl, 12.91. Found: C, 56.43; H, 2.76; N, 20.02; Cl, 12.97.

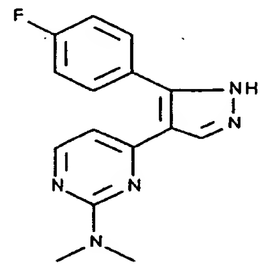
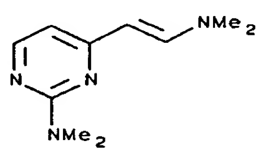
A solution of the compound prepared in step 3 of Example A-299 (1.5 g) and hydrazine hydrate (5mL) in ethanol was heated at reflux overnight. After the reaction mixture was cooled, the solvent was removed. The residue was partitioned between ethyl acetate and water. The organic phase was washed with brine, dried over magnesium sulfate and filtered. The filtrate was concentrated and the crude product was purified by recrystallization from ethyl acetate and hexane to give 0.5 g of product, 4-[3-(4-fluorophenyl)-1H-pyrazol-4-yl]-2(1H)-pyrimidinone hydrazone, as a pale yellow solid (38% yield), mp: 149-150 °C; Anal. Calc'd for $C_{13}H_{11}FN_6$: C, 57.77; H, 4.10; N, 31.10. Found: C, 57.70; H, 4.31; N, 30.73.

Example A-301



4-[3-(4-fluorophenyl)-1H-pyrazol-4-yl]-N,N-dimethyl-2-pyrimidinamine

Step 1: Preparation of



A solution of the compound prepared in step 2 of Example A-299 (3.0 g, 0.02 mol) and *tert*-butylbis(dimethylamino)methane (10.45 g, 0.06 mol) in 40 mL of DMF was stirred at 110 °C overnight. After the solvent was removed under vacuum, water was added and extracted with ethyl acetate. The organic layer was washed with brine, dried over magnesium sulfate and filtered. The filtrate was concentrated and purified by recrystallization from ethyl acetate and hexane to give 1.23 g of a yellow solid product (32% yield), mp: 76-77 °C; Anal. Calc'd for $C_{10}H_{16}N_4$: C, 62.47; H, 8.39; N, 29.14. Found: C, 62.19; H, 8.58; N, 29.02.

Step 2: Preparation of 4-[3-(4-fluorophenyl)-1H-pyrazol-4-yl]-N,N-dimethyl-2-pyrimidinamine

To a solution of the compound prepared in step 1 of the present Example (1.2 g, 0.0064 mol) and triethylamine (0.65 g, 0.0064 mol) in 10 mL of toluene was added 4-fluorobenzoyl chloride dropwise. The mixture was heated at reflux for 10 hours and the solvent was removed. The residue was partitioned between ethyl acetate and water. The organic layer was washed with brine, dried over magnesium sulfate and filtered. The filtrate was concentrated and the crude (1.6 g) was then dissolved in 50 mL of ethanol. The solution was treated with hydrazine hydrate (0.36 g, 0.006 mol) and the mixture was heated at reflux for 2 hours. After ethanol was removed, the residue was partitioned between water and ethyl acetate. The organic phase was washed with brine, dried over magnesium sulfate and filtered. BIOLOGICAL EVALUATION

p38 Kinase Assay

Cloning of human p38a:

The coding region of the human p38a cDNA was obtained by PCR-amplification from RNA isolated from the human monocyte cell line THP.1. First strand cDNA was synthesized from total RNA as follows: 2 μg of RNA was annealed to 100 ng of random hexamer primers in a 10 μl reaction by heating to 70 °C for 10 minutes followed by 2 minutes on ice. cDNA was then synthesized by adding 1 μl of RNAsin (Promega, Madison WI), 2 μl of 50 mM dNTP's, 4 μl of 5X buffer, 2 μl of 100 mM DTT and 1 μl (200 U) of Superscript II ™ AMV reverse transcriptase. Random primer, dNTP's and Superscript ™ reagents were all purchased from Life-Technologies, Gaithersburg, MA. The reaction was incubated at 42 °C for 1 hour. Amplification of p38 cDNA was performed by aliquoting 5 μl of the reverse transcriptase reaction into a 100 μl PCR reaction containing the following: 80 μl dH_2O, 2 μl 50 mM dNTP's, 1 μl each of forward and reverse primers

(50 pmol/μl), 10 μl of 10X buffer and 1 μl Expand TM polymerase (Boehringer Mannheim). The PCR primers incorporated Bam HI sites onto the 5' and 3' end of the amplified fragment, and were purchased from Genosys. The sequences of the forward and reverse primers were 5'-GATCGAGGATTCATGTCTCAGGAGAGGCCCA-3' and 5'GATCGAGGATTCTCAGGACTCCATCTCTTC-3' respectively. The PCR amplification was carried out in a DNA Thermal Cycler (Perkin Elmer) by repeating 30 cycles of 94 °C for 1 minute, 60 °C for 1 minute and 68 °C for 2 minutes. After amplification, excess primers and unincorporated dNTP's were removed from the amplified fragment with a Wizard TM PCR prep (Promega) and digested with Bam HI (New England Biolabs). The Bam HI digested fragment was ligated into BamHI digested pGEX 2T plasmid DNA (PharmaciaBiotech) using T-4 DNA ligase (New England Biolabs) as described by T. Maniatis, *Molecular Cloning: A Laboratory Manual, 2nd ed.* (1989). The ligation reaction was transformed into chemically competent *E. coli* DH10B cells purchased from Life-Technologies following the manufacturer's instructions. Plasmid DNA was isolated from the resulting bacterial colonies using a Promega Wizard™ miniprep kit. Plasmids containing the appropriate Bam HI fragment were sequenced in a DNA Thermal Cycler (Perkin Elmer) with Prism™ (Applied Biosystems Inc.). cDNA clones were identified that coded for both human p38a isoforms (Lee et al. Nature 372, 739). One of the clones which contained the cDNA for p38a-2 (CSBP-2) inserted in the cloning site of pGEX 2T, 3' of the GST coding region was designated pMON 35802. The sequence obtained for this clone is an exact match of the cDNA clone reported by Lee et al. This expression plasmid allows for the production of a GST-p38a fusion protein.

Expression of human p38a:

GST/p38a fusion protein was expressed from the plasmid pMON 35802 in *E. coli,* stain DH10B (Life Technologies, Gibco-BRL). Overnight cultures were grown in Luria Broth (LB) containing 100 mg/ml ampicillin. The next day, 500 ml of fresh LB was inoculated with 10 ml of overnight culture, and grown in a 2 liter flask at 37 °C with constant shaking until the culture reached an absorbance of 0.8 at 600 nm. Expression of the fusion protein was induced by addition of isopropyl b-D-thiogalactosidse (IPTG) to a final concentration of 0.05 mM. The cultures were shaken for three hours at room temperature, and the cells were harvested by centrifugation. The cell pellets were stored frozen until protein purification.

Purification of p38 Kinase-α:

All chemicals were from Sigma Chemical Co. unless noted. Twenty grams of *E. coli* cell pellet collected from five 1 L shake flask fermentations was resuspended in a volume of PBS (140 mM NaCl, 2.7 mM KCl, 10 mM Na_2HPO_4, 1.8 mM KH_2PO_4, pH 7.3) up to 200 ml. The cell suspension was adjusted to 5 mM DTT with 2 M DTT and then split equally into five 50 ml Falcon conical tubes. The cells were sonicated (Ultrasonics model W375) with a 1 cm probe for 3 X 1 minutes (pulsed) on ice. Lysed cell material was removed by centrifugation (12,000 x g, 15 minutes) and the clarified supernatant applied to glutathione-sepharose resin (Pharmacia).

Glutathione-Sepharose Affinity Chromatography:

Twelve ml of a 50% glutathione sepharose-PBS suspension was added to 200 ml clarified supernatant and incubated batchwise for 30 minutes at room temperature. The resin was collected by centrifugation (600 x g, 5 min) and washed with 2 x 150 ml PBS/1% Triton X-100,

followed by 4 x 40 ml PBS. To cleave the p38 kinase from the GST-p38 fusion protein, the glutathione-sepharose resin was resuspended in 6 ml PBS containing 250 units thrombin protease (Pharmacia, specific activity > 7500 units/mg) and mixed gently for 4 hours at room temperature. The glutathione-sepharose resin was removed by centrifugation (600 x g, 5 min) and washed 2 x 6 ml with PBS. The PBS wash fractions and digest supernatant containing p38 kinase protein were pooled and adjusted to 0.3 mM PMSF.

Mono Q Anion Exchange Chromatography:

The thrombin-cleaved p38 kinase was further purified by FPLC-anion exchange chromatography. Thrombin-cleaved sample was diluted 2-fold with Buffer A (25 mM HEPES, pH 7.5, 25 mM beta-glycerophosphate, 2 mM DTT, 5% glycerol) and injected onto a Mono Q HR 10/10 (Pharmacia) anion exchange column equilibrated with Buffer A. The column was eluted with a 160 ml 0.1 M-0.6 M NaCl/Buffer A gradient (2 ml/minute flowrate). The p38 kinase peak eluting at 200 mM NaCl was collected and concentrated to 3-4 ml with a Filtron 10 concentrator (Filtron Corp.).

Sephacryl S100 Gel Filtration Chromatography:

The concentrated Mono Q- p38 kinase purified sample was purified by gel filtration chromatography (Pharmacia HiPrep 26/60 Sephacryl S100 column equilibrated with Buffer B (50 mM HEPES, pH 7.5, 50 mM NaCl, 2 mM DTT, 5% glycerol)). Protein was eluted from the column with Buffer B at a 0.5 ml/minute flowrate and protein was detected by absorbance at 280 nm. Fractions containing p38 kinase (detected by SDS-polyacrylamide gel electrophoresis) were pooled and frozen at -80 °C. Typical purified protein yields from 5 L *E. coli* shake flasks fermentations were 35 mg p38 kinase.

In Vitro Assay

The ability of compounds to inhibit human p38 kinase alpha was evaluated using two in vitro assay methods. In the first method, activated human p38 kinase alpha phosphorylates a biotinylated substrate, PHAS-I (phosphorylated heat and acid stable protein-insulin inducible), in the presence of gamma ^{32}P-ATP (^{32}P-ATP). PHAS-I was biotinylated prior to the assay and provides a means of capturing the substrate which is phosphorylated during the assay. p38 Kinase was activated by MKK6. Compounds were tested in 10 fold serial dilutions over the range of 100 μM to 0.001 μM using 1% DMSO. Each concentration of inhibitor was tested in triplicate.

All reactions were carried out in 96 well polypropylene plates. Each reaction well contained 25 mM HEPES pH 7.5, 10 mM magnesium acetate and 50 μM unlabeled ATP. Activation of p38 was required to achieve sufficient signal in the assay. Biotinylated PHAS-I was used at 1-2 μg per 50 μl reaction volume, with a final concentration of 1.5 μM. Activated human p38 kinase alpha was used at 1 μg per 50 μl reaction volume representing a final concentration of 0.3 μM. Gamma ^{32}P-ATP was used to follow the phosphorylation of PHAS-I. ^{32}P-ATP has a specific activity of 3000 Ci/mmol and was used at 1.2 μCi per 50 μl reaction volume. The reaction proceeded either for one hour or overnight at 30 °C.

Following incubation, 20 μl of reaction mixture was transferred to a high capacity streptavidin coated filter plate (SAM-streptavidin-matrix, Promega) prewetted with phosphate buffered saline. The transferred reaction mix was allowed to contact the streptavidin membrane of the Promega plate for 1-2 minutes. Following capture of biotinylated PHAS-I with ^{32}P incorporated, each well was washed to remove unincorporated ^{32}P-ATP three times with 2M NaCl, three washes of 2M NaCl with 1% phosphoric, three washes of distilled water and finally a single wash

of 95% ethanol. Filter plates were air dried and 20 μl of scintillant was added. The plates were sealed and counted. Results are shown in Table 4.

A second assay format was also employed that is based on p38 kinase alpha induced phosphorylation of EGFRP (epidermal growth factor receptor peptide, a 21 mer) in the presence of ^{33}P-ATP. Compounds were tested in 10 fold serial dilutions over the range of 100μM to 0.001μM in 1% DMSO. Each concentration of inhibitor was tested in triplicate. Compounds were evaluated in 50μl reaction volumes in the presence of 25 mM Hepes pH 7.5, 10 mM magnesium acetate, 4% glycerol, 0.4% bovine serum albumin, 0.4mM DTT, 50μM unlabeled ATP, 25 μg EGFRP (200μM), and 0.05 uCi gamma ^{33}P-ATP. Reactions were initiated by addition of 0.09 μg of activated, purified human GST-p38 kinase alpha. Activation was carried out using GST-MKK6 (5:1,p38:MKK6) for one hour at 30 °C in the presence of 50μM ATP. Following incubation for 60 minutes at room temperature, the reaction was stopped by addition of 150μl of AG 1X8 resin in 900 mM sodium formate buffer, pH 3.0 (1 volume resin to 2 volumes buffer). The mixture was mixed three times with pipetting and the resin was allowed to settle. A total of 50μl of clarified solution head volume was transferred from the reaction wells to Microlite-2 plates. 150μl of Microscint 40 was then added to each well of the Microlite plate, and the plate was sealed, mixed, and counted.

TNF Cell Assays

Method of Isolation of Human Peripheral Blood Mononuclear Cells:

Human whole blood was collected in Vacutainer tubes containing EDTA as an anticoagulant. A blood sample (7 ml) was carefully layered over 5 ml PMN Cell Isolation Medium (Robbins Scientific) in a 15 ml round bottom centrifuge tube. The sample was centrifuged at 450-500 x g for 30-35 minutes in a swing out rotor at room temperature. After centrifugation, the top band of cells were removed and washed 3 times with PBS w/o calcium or magnesium. The cells were centrifuged at 400 x g for 10 minutes at room temperature. The cells were resuspended

in Macrophage Serum Free Medium (Gibco BRL) at a concentration of 2 million cells/ml.

LPS Stimulation of Human PBMs:

PBM cells (0.1 ml, 2 million/ ml) were co-incubated with 0.1 ml compound (10-0.41 μM, final concentration) for 1 hour in flat bottom 96 well microtiter plates. Compounds were dissolved in DMSO initially and diluted in TCM for a final concentration of 0.1% DMSO. LPS (Calbiochem, 20 ng/ml, final concentration) was then added at a volume of 0.010 ml. Cultures were incubated overnight at 37 °C. Supernatants were then removed and tested by ELISA for TNF-a and IL1-b. Viability was analyzed using MTS. After 0.1 ml supernatant was collected, 0.020 ml MTS was added to remaining 0.1 ml cells. The cells were incubated at 37 °C for 2-4 hours, then the O.D. was measured at 490-650 nM.

<u>Maintenance and Differentiation of the U937 Human Histiocytic Lymphoma Cell Line:</u>

U937 cells (ATCC) were propagated in RPMI 1640 containing 10% fetal bovine serum, 100 IU/ml penicillin, 100 μg/ml streptomycin, and 2 mM glutamine (Gibco). Fifty million cells in 100 ml media were induced to terminal monocytic differentiation by 24 hour incubation with 20 ng/ml phorbol 12-myristate 13-acetate (Sigma). The cells were washed by centrifugation (200 x g for 5 min) and resuspended in 100 ml fresh medium. After 24-48 hours, the cells were harvested, centrifuged, and resuspended in culture medium at 2 million cells/ml.

<u>LPS Stimulation of TNF production by U937 Cells:</u>

U937 cells (0.1 ml, 2 million/ml) were incubated with 0.1 ml compound (0.004-50 μM, final concentration) for 1 hour in 96 well microtiter plates. Compounds were prepared as 10 mM stock solutions in DMSO and diluted in

culture medium to yield a final DMSO concentration of 0.1% in the cell assay. LPS (E coli, 100 ng/ml final concentration) was then added at a volume of 0.02 ml. After 4 hour incubation at 37°C, the amount of TNF-α released in the culture medium was quantitated by ELISA. Inhibitory potency is expressed as IC50 (μM). Results of these TNF Cell Assays are shown in Table 5.

Rat Assay

The efficacy of the novel compounds in blocking the production of TNF also was evaluated using a model based on rats challenged with LPS. Male Harlen Lewis rats [Sprague Dawley Co.] were used in this model. Each rat weighed approximately 300 g and was fasted overnight prior to testing. Compound administration was typically by oral gavage (although intraperitoneal, subcutaneous and intravenous administration were also used in a few instances) 1 to 24 hours prior to the LPS challenge. Rats were administered 30 μg/kg LPS [salmonella typhosa, Sigma Co.] intravenously via the tail vein. Blood was collected via heart puncture 1 hour after the LPS challenge. Serum samples were stored at -20 °C until quantitative analysis of TNF-α by Enzyme Linked-Immuno-Sorbent Assay ("ELISA") [Biosource]. Additional details of the assay are set forth in Perretti, M., et al., Br. J. Pharmacol. (1993), 110, 868-874, which is incorporated by reference in this application.

Mouse Assay

Mouse Model Of LPS-Induced TNF Alpha Production:

TNF alpha was induced in 10-12 week old BALB/c female mice by tail vein injection with 100 ng lipopolysaccharide (from S. Typhosa) in 0.2 ml saline. One hour later mice were bled from the retroorbital sinus and TNF concentrations in serum from clotted blood were quantified by ELISA. Typically, peak levels of serum TNF ranged from 2-6 ng/ml one hour after LPS injection.

The compounds tested were administered to fasted mice by oral gavage as a suspension in 0.2 ml of 0.5% methylcellulose and 0.025% Tween 20 in water at 1 hour or 6 hours prior to LPS injection. The 1 hour protocol allowed evaluation of compound potency at Cmax plasma levels whereas the 6 hour protocol allowed estimation of

compound duration of action. Efficacy was determined at each time point as percent inhibition of serum TNF levels relative to LPS injected mice that received vehicle only.

Additional results obtained using the above-described assays are set forth in Table 6 below. p38 assay and U937 cell assay results are expressed as IC_{50} (μm). Mouse-LPS assay results are expressed as percent inhibition.

Induction And Assessment Of Collagen-Induced Arthritis In Mice:

Arthritis was induced in mice according to the procedure set forth in J.M. Stuart, Collagen Autoimmune Arthritis, Annual Rev. Immunol. 2:199 (1984), which is incorporated herein by reference. Specifically, arthritis was induced in 8-12 week old DBA/1 male mice by injection of 50 μg of chick type II collagen (CII) (provided by Dr. Marie Griffiths, Univ. of Utah, Salt Lake City, UT) in complete Freund's adjuvant (Sigma) on day 0 at the base of the tail. Injection volume was 100 μl. Animals were boosted on day 21 with 50 μg of CII in incomplete Freund's adjuvant (100 μl volume). Animals were evaluated several times each week for signs of arthritis. Any animal with paw redness or swelling was counted as arthritic. Scoring of arthritic paws was conducted in accordance with the procedure set forth in Wooley et al., Genetic Control of Type II Collagen Induced Arthritis in Mice: Factors Influencing Disease Suspectibility and Evidence for Multiple MHC Associated Gene Control., Trans. Proc., 15:180 (1983). Scoring of severity was carried out using a score of 1-3 for each paw (maximal score of 12/mouse). Animals displaying any redness or swelling of digits or the paw were scored as 1. Gross swelling of the whole paw or deformity was scored as 2. Ankylosis of joints was scored as 3. Animals were evaluated for 8 weeks. 8-10 animals per group were used.

Preparation And Administration Of Compounds:

The compounds tested on mice having collagen-induced arthritis were prepared as a suspension in 0.5% methylcellulose (Sigma, St. Louis, MO), 0.025% Tween 20 (Sigma). The compound suspensions were administered by oral gavage in a volume of 0.1 ml b.i.d. Administration began on day 20 post collagen injection and continued

daily until final evaluation on day 56. Scoring of arthritic paws was conducted as set forth above. Assay results are set forth in Table 7.

Also embraced within this invention is a class of pharmaceutical compositions comprising the active compounds of this invention in association with one or more non-toxic, pharmaceutically-acceptable carriers and/or diluents and/or adjuvants (collectively referred to herein as "carrier" materials) and, if desired, other active ingredients. The active compounds of the present invention may be administered by any suitable route, preferably in the form of a pharmaceutical composition adapted to such a route, and in a dose effective for the treatment intended. The active compounds and composition may, for example, be administered orally, intravascularly (IV), intraperitoneally, subcutaneously, intramuscularly (IM) or topically. For oral administration, the pharmaceutical composition may be in the form of, for example, a tablet, hard or soft capsule, lozenges, dispensable powders, suspension or liquid. The pharmaceutical composition is preferably made in the form of a dosage unit containing a particular amount of the active ingredient. Examples of such dosage units are tablets or capsules. The active ingredient may also be administered by injection (IV, IM, subcutaneous or jet) as a composition wherein, for example, saline, dextrose, or water may be used as a suitable carrier. The pH of

the composition may be adjusted, if necessary, with suitable acid, base, or buffer. Suitable bulking, dispersing, wetting or suspending agents, including mannitol and PEG 400, may also be included in the composition. A suitable parenteral composition can also include a compound formulated as a sterile solid substance, including lyophilized powder, in injection vials. Aqueous solution can be added to dissolve the compound prior to injection. The amount of therapeutically active compounds that are administered and the dosage regimen for treating a disease condition with the compounds and/or compositions of this invention depends on a variety of factors, including the age, weight, sex and medical condition of the subject, the severity of the inflammation or inflammation related disorder, the route and frequency of administration, and the particular compound employed, and thus may vary widely. The pharmaceutical compositions may contain active ingredients in the range of about 0.1 to 1000 mg, preferably in the range of about 7.0 to 350 mg. A daily dose of about 0.01 to 100 mg/kg body weight, preferably between about 0.1 and about 50 mg/kg body weight and most preferably between about 0.5 to 30 mg/kg body weight, may be appropriate. The daily dose can be administered in one to four doses per day. In the case of skin conditions, it may be preferable to apply a topical preparation of compounds of this invention to the affected area two to four times a day. For disorders of the eye or other external tissues, e.g., mouth and skin, the formulations are preferably applied as a topical gel, spray, ointment or cream, or as a suppository, containing the active ingredients in a total amount of, for example, 0.075 to 30% w/w, preferably 0.2 to 20% w/w and most preferably 0.4 to 15% w/w. When formulated in an ointment, the active ingredients may be employed with either paraffinic or a water-miscible ointment base.

Alternatively, the active ingredients may be formulated in a cream with an oil-in-water cream base. If desired, the aqueous phase of the cream base may include, for example at least 30% w/w of a polyhydric alcohol such as propylene glycol, butane-1,3-diol, mannitol, sorbitol, glycerol, polyethylene glycol and mixtures thereof. The topical formulation may desirably include a compound which enhances absorption or penetration of the active ingredient through the skin or other affected areas. Examples of such dermal penetration enhancers include dimethylsulfoxide and related analogs. The compounds of this invention can also be administered by a transdermal device. Preferably topical administration will be accomplished using a patch either of the reservoir and porous membrane type or of a solid matrix variety. In either case, the active agent is delivered continuously from the reservoir or microcapsules through a membrane into the active agent permeable adhesive, which is in contact with the skin or mucosa of the recipient. If the active agent is absorbed through the skin, a controlled and predetermined flow of the active agent is administered to the recipient. In the case of microcapsules, the encapsulating agent may also function as the membrane. The transdermal patch may include the compound in a suitable solvent system with an adhesive system, such as an acrylic emulsion, and a polyester patch. The oily phase of the emulsions of this invention may be constituted from known ingredients in a known manner. While the phase may comprise merely an emulsifier, it may comprise a mixture of at least one emulsifier with a fat or an oil or with both a fat and an oil. Preferably, a hydrophilic emulsifier is included together with a lipophilic emulsifier which acts as a stabilizer. It is also preferred to include both an oil and a fat. Together, the emulsifier(s) with or without stabilizer(s) make-up the so-called emulsifying wax, and

the wax together with the oil and fat make up the so-called emulsifying ointment base which forms the oily dispersed phase of the cream formulations. Emulsifiers and emulsion stabilizers suitable for use in the formulation of the present invention include Tween 60, Span 80, cetostearyl alcohol, myristyl alcohol, glyceryl monostearate, and sodium lauryl sulfate, among others. The choice of suitable oils or fats for the formulation is based on achieving the desired cosmetic properties, since the solubility of the active compound in most oils likely to be used in pharmaceutical emulsion formulations is very low. Thus, the cream should preferably be a non-greasy, non-staining and washable product with suitable consistency to avoid leakage from tubes or other containers. Straight or branched chain, mono- or dibasic alkyl esters such as di-isoadipate, isocetyl stearate, propylene glycol diester of coconut fatty acids, isopropyl myristate, decyl oleate, isopropyl palmitate, butyl stearate, 2-ethylhexyl palmitate or a blend of branched chain esters may be used. These may be used alone or in combination depending on the properties required. Alternatively, high melting point lipids such as white soft paraffin and/or liquid paraffin or other mineral oils can be used. Formulations suitable for topical administration to the eye also include eye drops wherein the active ingredients are dissolved or suspended in suitable carrier, especially an aqueous solvent for the active ingredients. The anti-inflammatory active ingredients are preferably present in such formulations in a concentration of 0.5 to 20%, advantageously 0.5 to 10% and particularly about 1.5% w/w. For therapeutic purposes, the active compounds of this combination invention are ordinarily combined with one or more adjuvants appropriate to the indicated route of administration. If administered *per os*, the compounds may be admixed with lactose, sucrose, starch powder,

cellulose esters of alkanoic acids, cellulose alkyl esters, talc, stearic acid, magnesium stearate, magnesium oxide, sodium and calcium salts of phosphoric and sulfuric acids, gelatin, acacia gum, sodium alginate, polyvinylpyrrolidone, and/or polyvinyl alcohol, and then tableted or encapsulated for convenient administration. Such capsules or tablets may contain a controlled-release formulation as may be provided in a dispersion of active compound in hydroxypropylmethyl cellulose. Formulations for parenteral administration may be in the form of aqueous or non-aqueous isotonic sterile injection solutions or suspensions. These solutions and suspensions may be prepared from sterile powders or granules having one or more of the carriers or diluents mentioned for use in the formulations for oral administration. The compounds may be dissolved in water, polyethylene glycol, propylene glycol, ethanol, corn oil, cottonseed oil, peanut oil, sesame oil, benzyl alcohol, sodium chloride, and/or various buffers. Other adjuvants and modes of administration are well and widely known in the pharmaceutical art.

All patent documents listed herein are incorporated by reference.

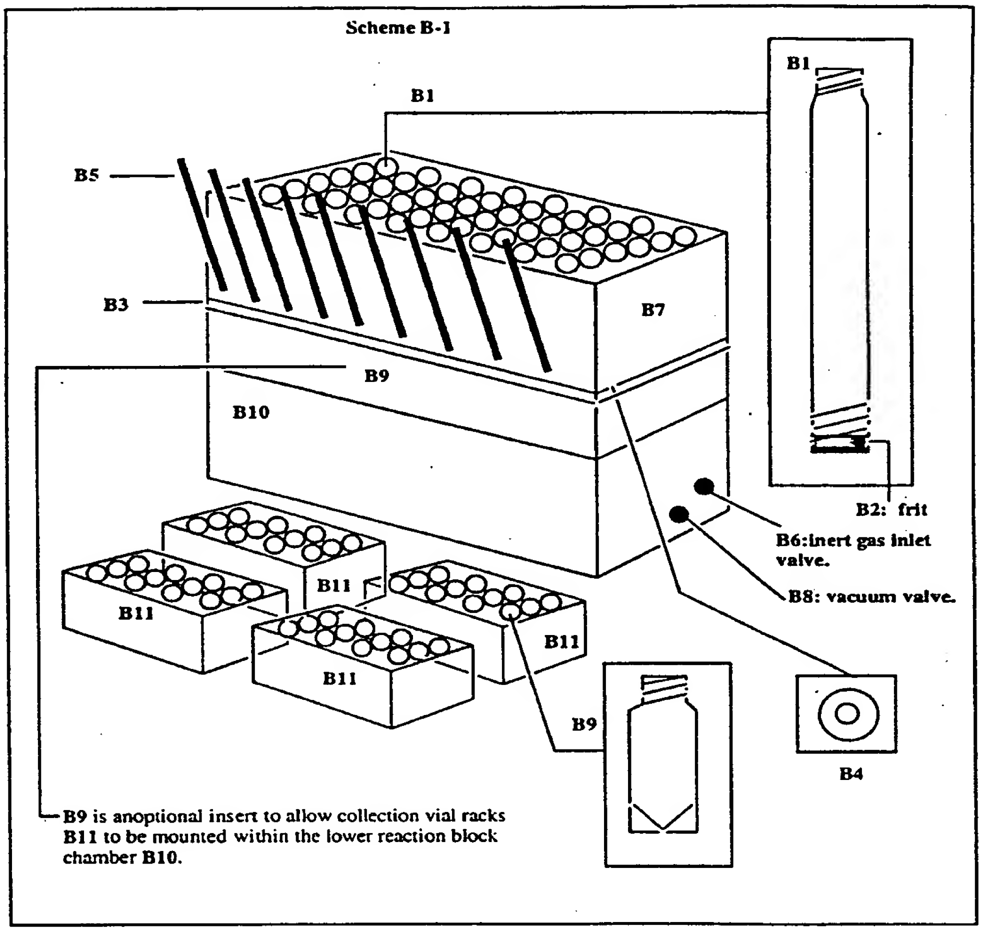
Although this invention has been described with respect to specific embodiments, the details of these embodiments are not to be construed as limitations.

Description of parallel array synthesis methodology utilized to prepare compounds of Examples B-i, B-ii, and B-iii.

Scheme B-1 describes the parallel array reaction blocks that were utilized to prepare compounds of Examples B-0001 through B-1574, and by analogy could also be used to prepare compounds of Examples B-1575 through B-2269. Parallel reactions were performed in multi-chamber reaction blocks. A typical reaction block is capable of performing 48 parallel reactions, wherein a unique compound is optionally prepared in each reaction vessel **B1**. Each reaction vessel **B1** is made of either polypropylene or pyrex glass and contains a frit **B2** toward the base of the vessel. Each reaction vessel is connected to the reaction block valve assembly plate **B3** via leur-lock attachment or through a threaded connection. Each vessel valve **B4** is either opened or closed by controlling the leur-lock position or by the opening or closing of levers **B5** within a valve assembly plate row. Optionally, solutions can be either drained or maintained above the vessel frits by leaving the valves in the opened position and controlling the back pressure beneath the valve assembly plate by control of inert gas flow through the inert gas inlet valve **B6**. The parallel reactions that are performed in these reaction blocks are allowed to progress by incubation in a jacketed, temperature controlled shaking station. Temperature control of the reaction chambers is effected by passing a heat-transfer liquid through jacketed aluminum plates that make contact with the reaction block

mantle **B7**. Mixing is effected at the shaking station by either vertical orbital shaking of the up-right reaction block or by lateral shaking of the reaction block tilted on its side.

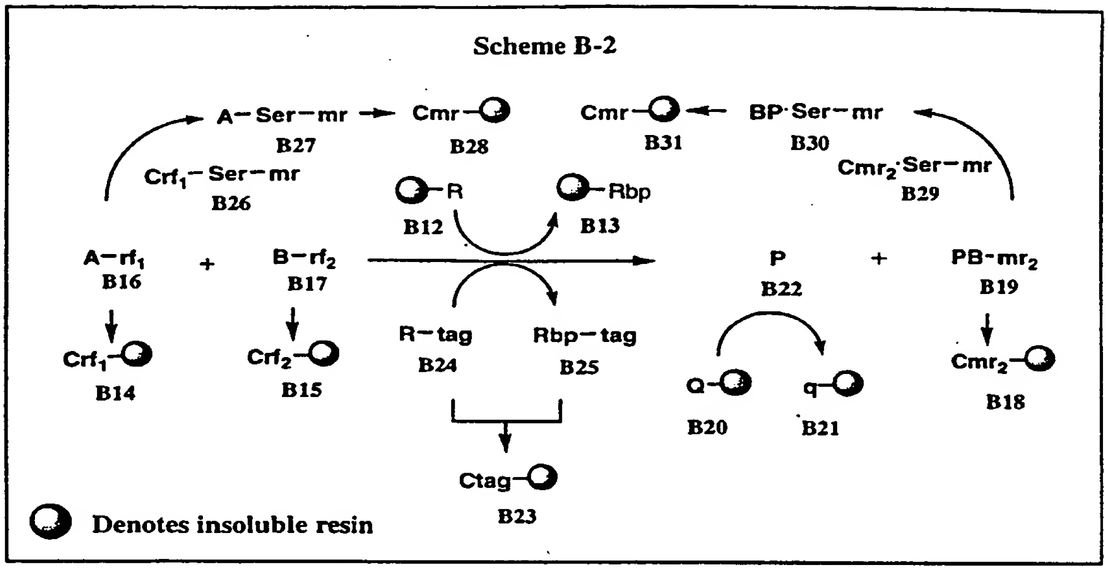
Functionalized resins are optionally added to each reaction vessel **B1** during the course of reaction or at the conclusion of the reaction. These functionalized resins enable the rapid purification of each reaction vessel product. Vacuum filtration of the reaction block apparatus by opening of the vacuum valve **B8** allows purified products to be separated from resin-sequestered non-product species. Valve **B8** is located on the bottom reaction block chamber **B10** which houses the quadrant collection vial racks **B11**. The desired products are obtained as filtrates in unique collection vials **B9**. Removal of solvent from these collection vials affords desired products.



Scheme B-2 illustrates the various utilizations of functionalized resins to purify reaction vessel products **B22** prior to filtration from the fritted vessels **B1** into collection vials **B9**. Said functionalized resins perform as 1) resin-bound reagents **B12**, which give rise to resin-bound reagent byproducts **B13**; 2) sequestrants **B14** or **B15** of excess solution-phase reactants **B16** or **B17**, respectively. Solution-phase reactants **B16** and **B17** contain inherent reactive functionality $-rf_1$ and $-rf_2$

which enable their chemoselective sequestration by the complementary reactive functionality $-Crf_1$ and $-Crf_2$ attached to resins **B14** and **B15**; 3) sequestrants **B18** of solution-phase byproducts **B19**. Byproduct **B19** contains molecular recognition functionality $-mr_2$ which enables its chemoselective sequestration by the complementary functionality $-Cmr_2$ attached to resin **B18**; 4) reaction-quenching resins **B20** which give rise to quenched resins **B21**. Resin **B20** contains functionality -Q which mediates reaction quenching (for instance, proton transfer) of product **B22** to form a desired isolable form of product **B22**. Upon performing reaction quench, the resin **B20** is converted to resin **B21** wherein -q represents the spent functionality on resin **B21** ; 5) sequestrants **B23** of chemically-tagged reagents **B24** and their corresponding reagent byproducts **B25**. The soluble reagent **B24** contains a bifunctional chemical group, -tag, which is inert to the reaction conditions but is used to enable the post-reaction sequestration of **B24** by the complementary functionality -Ctag attached to resin **B23**. Additionally, the soluble reagent byproduct **B25**, formed during the course of reaction, contains the same chemical function -tag that also enables its sequestration by resin **B23**. Additionally, some reactants **B16**, particularly sterically-hindered reactants and/or electron deficient nucleophiles, contain poorly sequestrable functionality (rf1 in this case is a poorly sequestable functionality). These poorly sequestable reactants **B16** can be transformed *in situ* to more robustly sequestrable species **B27** through their reaction with sequestration-enabling-reagents **B26**. **B26** contain highly reactive, complementary functionality Crf_1 which reacts with **B16** to form **B27** *in situ*. The

bifunctional molecular recognition functionality, mr, contained within **B26** is also present on the *in situ* derivatized **B27**. Both **B26** and **B27** are sequestered by the complementary molecular recognition functionality attached to resin **B28**. By analogy, some reactions contain poorly sequestable byproducts **B19**, wherein the molecular recognition functionality mr_2 in this case is not able to mediate the direct sequestration of **B19** by the complementary functionality attached to resin **B18**. Similar use of the bifunctional sequestration-enabling-reagent **B29** transforms **B19** into the more readily sequestrable species **B30**. The imparted molecular recognition functionality, mr, present in **B30** is readily sequestered by the complementary functionality, Cmr, attached to resin **B31**. In some reactions, multiple sequestration resins are utilized simultaneously to perform reaction purifications. Even resins containing incompatible (mutually reactive) functional groups can be used simultaneously because these resins scavenge complementary functionalized solution phase reactants, reagents, or byproducts from solution phase faster than resin cross-neutralization. Similarly, resins containing mutually reactive or neutralizing reaction-quenching functionality are able to quench solution phase reactants, products, or byproducts faster than resin cross-neutralization.



Scheme B3 describes the modular robotics laboratory environment that was utilized to prepare compounds of Examples B0001 through Bxxxx. Chemicals that are utilized in the robotics laboratory are weighed and then dissolved or suspended into solvents at Station #1 (Automated Chemistry Prep Station). Thus, solutions or suspensions of known molarity are prepared for use at the other robotics workstations. Station #1 also optionally bar-code labels each chemical solution so that its identity can be read by bar-code scanning at this and other robotics workstations.

Reactions are initiated at the modular Stations #2 and #2 DUP. Station #2DUP is defined as a duplicate of Station #2 and is used to increase capacity within the robotics laboratory. A reaction block is mounted at Station #2 or #2 DUP. Also, racks containing reactants, reagents, solvents, and resin slurries are also mounted at Station #2 or #2 DUP. Under the control of a chemical

informatics mapping file, reactions are initiated by the transfer of reactant solutions, reagent solutions, solvents, and/or resin slurries into each mounted reaction block vessel. The transfer of known volumes of solutions, suspensions, or solvents is mediated by syringes which control a one-up septum piercing/argon purging cannula, a wide-bore resin slurry-despensing cannula, or by a six-up cannula which can simultaneously deliver volumes to a row of six reaction vessels. The reaction block and/or chemical solution racks may be optionally cooled below room temperature during the chemical solution transfer operations. After the transfer of chemical solutions and solvents has been performed by Station#2 or #2DUP, incubation of the reaction block may occur while the reaction block is mounted at the robot station. Preferably, however, the reaction block is removed after all volume transfers are complete and the reaction block is brought to ambient temperature. The reaction block is transferred off-line to either a vertical- or lateral shaking Incubator Station #5.

The Automated weighing/archival Station #3 performs the functions of weighing empty collection vials (to obtain tare weights of collection vials) and also performs the functions of weighing collection vials containing filtered, purified products (to obtain gross weights of collection vials). After product-containing collection vials have been weighed (gross weight determinations) at workstation #3, the collection vial products are optionally redissolved into an organic solvent at workstation #3. Transfer of solvents is accomplished with syringes which control a mounted one-up septum-piercing/argon purging cannula. Each product-containing

collection vial is prepared as a solution of known molarity as directed and recorded by the chemical informatics system. These product solutions may be subsequently mounted at Station #2 or #2DUP for subsequent reaction steps or taken to Station #7 or #7DUP for analytical processing.

Rapid solvent evaporation of product-containing collection vials is accomplished by mounting the collection racks at Savant Automated Solvent Evaporation Stations #4, #4 DUP, or #4 TRIP, wherein #4DUP and #4TRIP are defined as a duplicate and a triplicate of Station #4 to increase the capacity for solvent removal within the robotics laboratory. Commercially available solvent removal stations were purchased from the Savant Company (model # SC210A speedvac unit equipped with model # RVT4104 vapor trap and model # VN100 vapornet cryopump).

Stations #7 and #7DUP perform analytical processing functions. Station #7DUP is defined as a duplicate of Station #7 to increase capacity within the robotics laboratory. Product-containing collection racks are mounted at either of these stations. Each product-containing collection vial is then prepared as a solution of known molarity as directed and recorded by the chemical informatics mapping file. Optionally, this dissolution function is performed by prior processing of the collection vial rack at Station #3 as described above. Station#7 or #7DUP, under the control of the chemical informatics mapping file, transfers aliquots of each product vial into unique and identifable microtiter plate wells that are utilized to perform analytical determinations.

One such microtiter plate is prepared at Station #7 or #7DUP for subsequent utilization at the Automated HPLC/Mass Spectrometer Station #8 or #8DUP. Station #8DUP is a duplicate of Station #8 to increase the analytical capacity of the robotics laboratory. Stations #8 and #8DUP are commercially available benchtop LC/Mass spec units purchased from Hewlett Packard (model HP1100 HPLC connected to HP1100 MSD (G1946A) mass spectrometer; this unit is also equipped with a model# G1322A solvent degasser, model # G1312A binary pump, a model # G1316A column heater, and a model # G1315A diode array detector. The HP unit has been interfaced with a commercially available autosampler rack (Gilson Company # 215 autosampler). Station #8 or #8DUP is utilized for the determination of product purity and identity by performing high performance liquid chromatography (HPLC) and companion atmospheric pressure chemi-ionization (APCI) or electrospray mass spectrometry for molecular weight determination.

Another microtiter plate is prepared at Station #7 or #7DUP for subsequent utilization at a commercially available flow-probe Varian NMR spectrometer Station #10 (Varian Instruments flow probe NMR, 300 MHz, interfaced with a commercially available Gilson 215 autosampler). Proton, ^{13}-Carbon, and/or ^{19}-Fluorine NMR spectra are determined at this Station #10.

Other microtiter plates are optionally mounted at Station #7 or #7DUP for the purpose of preparing product-containing plates for biological assays. Aliquots of product-containing collection vials are transferred to these biological assay microtiter plates under the control of the chemical informatics mapping file. Identity and amount of each transferred product is

recorded by the chemical informatics system for retrieval by biologists who perform the biological assaying of products.

The Fourier Transfrom InfraRed (FT-IR) Spectrometer Station #11 is utilized to analyze resins for the identity of organic functional groups chemically attached to these resins. The resins, as mentioned above, contain chemical functionality utilized as reagents, chemoselective sequestrants, or reaction quenching media for the workup and purification of the crude product mixtures contained within reaction block vessels. The robotics laboratory utilizes a commercially available FT-IR spectrometer purchased from Nicolet Instruments (model # MagnaIR 560 interfaced with an InspectIR microscope for resin mounting and positioning).

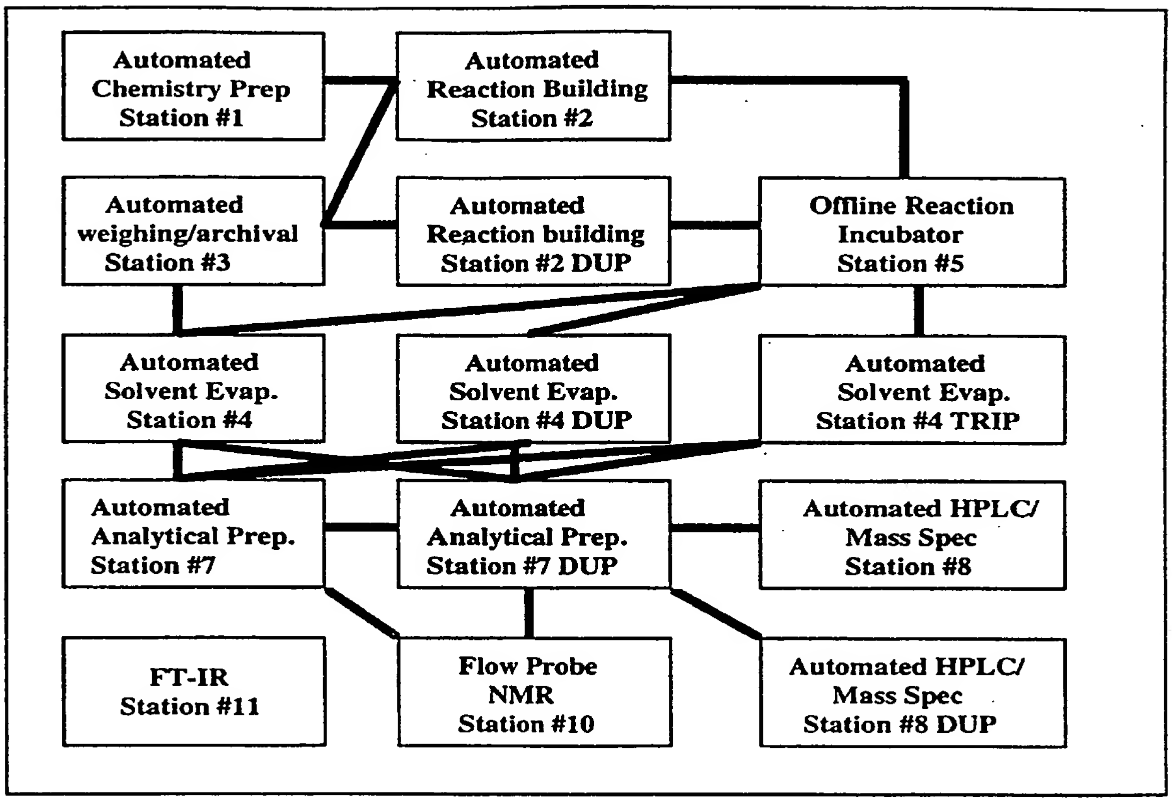
The lines interconnecting the modular Stations denote the transfer of chemical racks, reaction blocks, and/or collection vial racks from one modular Station to another.



The ChemLib IT system is a composite of software running on the client's desktop and software running on a remote server.

The ChemLib IT system is a client/server software application developed to support and document the data handling flow in the robotics laboratory described above. This IT system integrates the chemist with the robotics synthesis laboratory and manages the data generated by this processes.

The software running on the server warehouses all the electronic data for the robotics chemistry unit. This

server, a Silicon Graphics IRIX station v6.2, runs the database software, Oracle 7 v7.3.3.5.0, that warehouses the data. Connection from the client's desktop to the server is provided by Oracle's TCP/IP Adapter v2.2.2.1.0 and SQL*Net v2.2.2.1.0A. SQL*Net is Oracle's network interface that allows applications running on the client's desktop to access data in Oracles' database. The client's desktop is Microsoft Windows 95. The ChemLib IT system client software is composed of Omnis7 v3.5 and Microsoft Visual C++ v5.0. This composition on the client side is what is herein referred to as ChemLib. ChemLib communicates with the server for its data via Oracle's PL/SQL v2.3.3.4.0. These PL/SQL calls within ChemLib creates a network socket connection to Oracle's SQL*Net driver and the TCP/IP Adapter thereby allowing access to the data on the server.

A "library" is defined as a composite number of wells, where each well defines a single compound. ChemLib defines a library in a module called the *Electronic Spreadsheet*. The *Electronic Spreadsheet* is then a composite of n-number of wells containing the components that are required to synthesize the compound that exist in each these well(s).

The chemist begins by populating the *Electronic Spreadsheet* with those components required for the compound synthesis. The identity and the availability of these components are defined in the *Building Block Catalog* module of ChemLib. The *Building Block Catalog* is a catalog of a listing of all reagents, solvents, peripherals available in the robotics laboratory. Upon selecting the components for each compound we also

declare the quantity of each component to be utilized. The quantity of each component can be identified by its molarity and volumetric amounts (ul) or by it's solid state form (mg). Therefore a well in the *Electronic Spreadsheet* defines a compound that is identified by its components and the quantity of each of these components.

The assembly or the synthesis of these components for each compound in the Electronic Spreadsheet is defined in the *WS Sequence* module of ChemLib. The *Define WS Sequence* module identifies the synthesis steps to be performed at the robotics workstations and any activities to be performed manually or off-line from the robotics workstation. With this module we identify which components from the *Electronic Spreadsheet* and the activity that should be performed with this component in the robotics laboratory. In the *Define WS Sequence* module the chemist chooses from a list of activities to be performed in the robotics laboratory and assembles them in the order in which they are to occur. The ChemLib system takes these set of activities identified, and with the component data in the *Electronic Spreadsheet* assembles and reformats these instructions into terminology for the robotics workstation use. This robotics terminology is stored in a 'sequence' file on a common server that is accessible by the robotics workstation.

The robotics workstation performs the synthesis in a reaction block apparatus as described. Each well in the *Electronic Spreadsheet* is tracked and mapped to a unique location in the reaction block apparatus on the robotics workstation. The compound or product synthesized at the

robotics workstation in the reaction block is then captured into collection vials.

The collection vials are first tarred then grossed on the robotics workstation after collecting their products from the reaction block. These weights (tare and gross) are recorded into the ChemLib system with the *Tare/Gross Session* module. The *Tare/Gross Session* module then calculates the product or compound yields and its final mass.

Preparation of the compound for analytical analysis and screening is defined by the *Analytical WS Setup* module in ChemLib. The *Analytical WS Setup* module identifies the dilution factor for each well in the *Electronic Spreadsheet*, based on the compound's product yield and the desired molar concentration. This identifies the quantity, in uL, to be transferred at the robotics workstation, to a specific location on the MTP (microtiter plate) to be sent for analysis and/or biological assaying. The mass spectrometric and HPLC results for each well are recorded and scored into the ChemLib system.

The *Dilute/Archive WS* module further identifies each compound by mapping the compound's well from the *Electronic Spreadsheet* to a specific MX block location for long term storage and archival as part of the registration process.

All communications between ChemLib and the robotics workstations are by ASCII files. These files are placed on a server by the ChemLib system that is accessible by

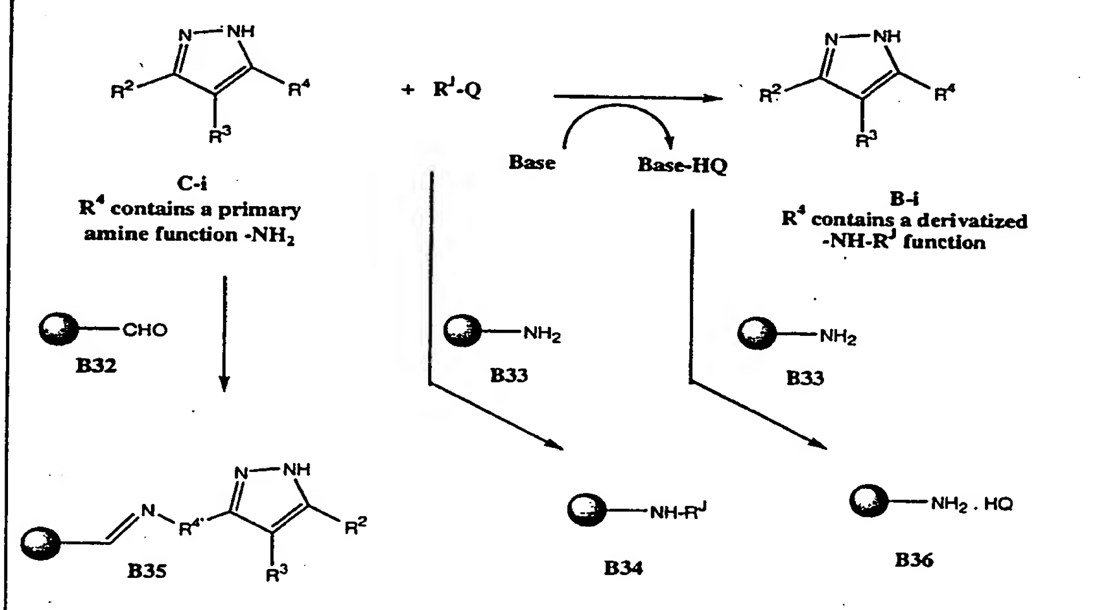
the robotics workstations. Reports generated by the robotics workstations are also placed on the server where the ChemLib system can read these files to record the data generated. Each robotics workstation consists of robotics hardware by Bohdan Automation, Inc. Mundelein, Illinois, and a PC currently running Microsoft Windows for Workgroup v3.11 and Ethernet software. The robotics workstation PC is logged into the network for one-way communication that allows the workstation to access the server for file access only.

General Scheme B4

Scaffold **C-i** with a primary amine functionality contained within the R^4 substituent is reacted in spatially addressed, parallel array reaction block vessels with excess of electrophiles $\mathbf{R^J\text{-}Q}$ wherein Q is chloro, bromo, or an acid activating group including but not limited to N-hydroxysuccinimide. $\mathbf{R^J\text{-}Q}$ includes acid chlorides, alkyl chloroformates, sulfonyl chlorides, activated esters of carboxylic acids, activated carbamates, and isocyanates. Reaction of scaffold **C-i** with $\mathbf{R^J\text{-}Q}$ is effected in the presence of a tertiary amine base at room temperature in a mixture of a polar aprotic solvent and/or a halogenated solvent. As illustrated in Scheme B-4 the products of the general formulae **B-i** are isolated in purified form by addition of a carbonyl-functionalized resin **B32** which covalently sequesters any unreacted primary amine scaffold **C-i** as resin-bound adduct **B35**, and also by the addition of a primary amine-functionalized resin **B33** which covalently sequesters any remaining electrophile $\mathbf{R^J\text{-}Q}$ from each reaction mixture as

resin-bound adduct **B34**. Resin **B33** also sequesters the HQ byproduct from the reaction mixture by proton transfer from solution-phase **Base-HQ**. Incubation at room temperature, filtration, rinsing of the resin cake, and concentration of the filtrates affords purified products **B-i** filtered away from resin-bound adducts **B32**, **B33**, **B34**, **B35**, and **B36**.

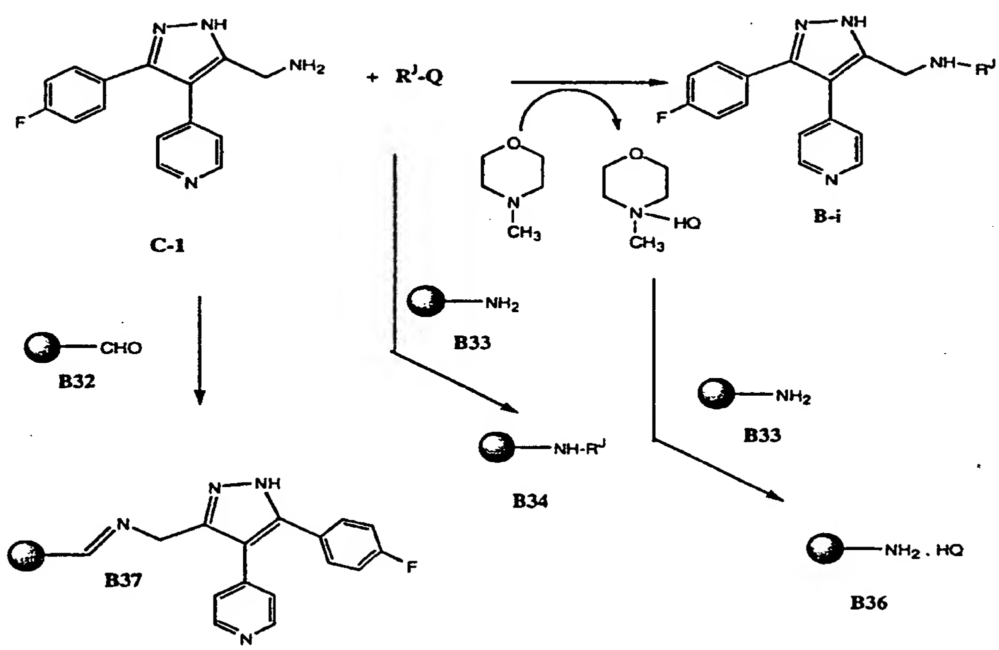
Scheme B-4



Scheme B-5 specifically illustrates the derivatization of the primary amine-containing scaffold **C1** to afford the desired products **B-i** in a parallel array synthesis format. In a parallel array synthesis reaction block, individual reaction products are prepared in each of multiple reaction block vessels in a spatially

addressed format. A solution of the desired primary amine-containing scaffold **C1** (limiting amount,) in dimethylformamide (DMF) is added to the reaction vessels followed by a 4.0 fold stoichiometric excess solution of N-methylmorpholine in DMF. To each reaction vessel is then added the electrophiles: either a 2.0 fold stoichiometric excess when R^J-Q is an acid chloride or alkyl chloroformate, or a 1.5 fold stoichiometric excess when R^J-Q is a sulfonyl chloride, or a 1.25 fold stoichiometric excess when R^J-Q is an isocyanate. Excess electrophiles and N-methylmorpholine were used to effect more rapid and/or more complete conversion of scaffold C1 to products B-0001-B-0048 compared to reactions that do not utilize stoichiometric excesses of electrophiles and N-methylmorpholine. The reaction mixtures are incubated at ambient temperature for 2-3 h. Each reaction vessel is then charged with a large excess (15-20 fold stoichiometric excess) of the amine-functionalized resin **B33** and the aldehyde-functionalized resin **B32**. The resin-charged reaction block is shaken vertically for 14-20 h on an orbital shaker at ambient temperature to allow optimum agitation of the resin-containing vessel mixtures. The excess electrophiles R^J-Q and any unreacted scaffold amine **C1** are removed from the reaction medium as insoluble adducts **B34** and **B37** respectively. In addition the N-methylmorpholine hydrochloride salt formed during the course of the reaction is also neutralized to its free base form by proton transfer reaction to the amine-functionalized resin **B33**. Simple filtration of the insoluble resin- adducts **B32**, **B33**, **B34**, **B36**, and **B37**, rinsing of the resin cake with dichloroethane, and evaporation of the filtrates affords the desired products **B-i** in purified form.

Scheme B-5

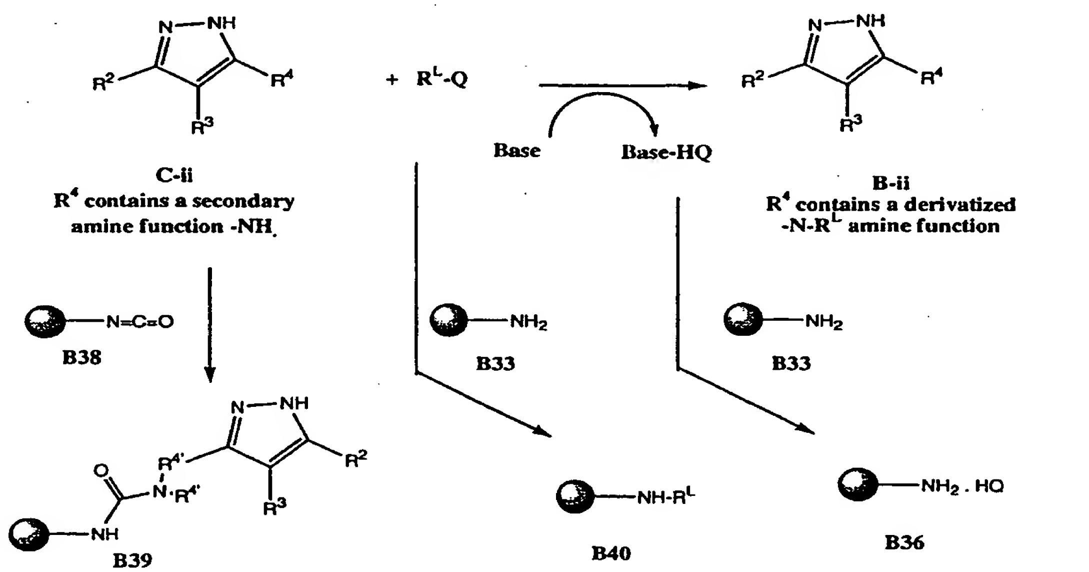


Scheme B-6 illustrates a general synthetic method involving the parallel array reaction of a scaffold **C-ii** containing a secondary amine functionality within the definition of the R^4 substituent. Each reaction vessel is charged with the secondary amine-containing scaffold **C-ii**, followed by the introduction of a stoichiometric excess of an optionally unique electrophile R^L-Q into each vessel, wherein Q is chloro, bromo, or an acid activating group including but not limited to N-hydroxysuccinimide. R^L-Q includes acid chlorides, alkyl chloroformates,

sulfonyl chlorides, activated esters of carboxylic acids, activated carbamates, and isocyanates. Reaction of scaffold **C-ii** with R^L-Q is effected in the presence of tertiary amine base at room temperature or elevated temperature in a mixture of a polar aprotics solvent and/or a halogenated solvent. After solution-phase reactions have progressed to afford crude product mixtures in each vessel, the products

B-ii are isolated in purified form by the addition of the isocyanate-functionalized resin **B38** which covalently sequesters remaining secondary amine scaffold **C-ii** as resin-bound adduct **B39**, and also by the addition of the primary amine-functionalized resin **B33** which covalently sequesters remaining electrophile R^L-Q from each reaction vessel as resin-bound adducts **B40**. Resin **B33** also sequesters the HQ byproduct in each vessel as **B36**, formed by proton transfer from solution-phase Base-HQ. Incubation with these resins, either simultaneously or sequentially, followed by filtration, rinsing, and concentration of the filtrates affords purified products **B-ii** filtered away from resin-adducts **B33**, **B36**, **B38**, **B39**, and **B40**.

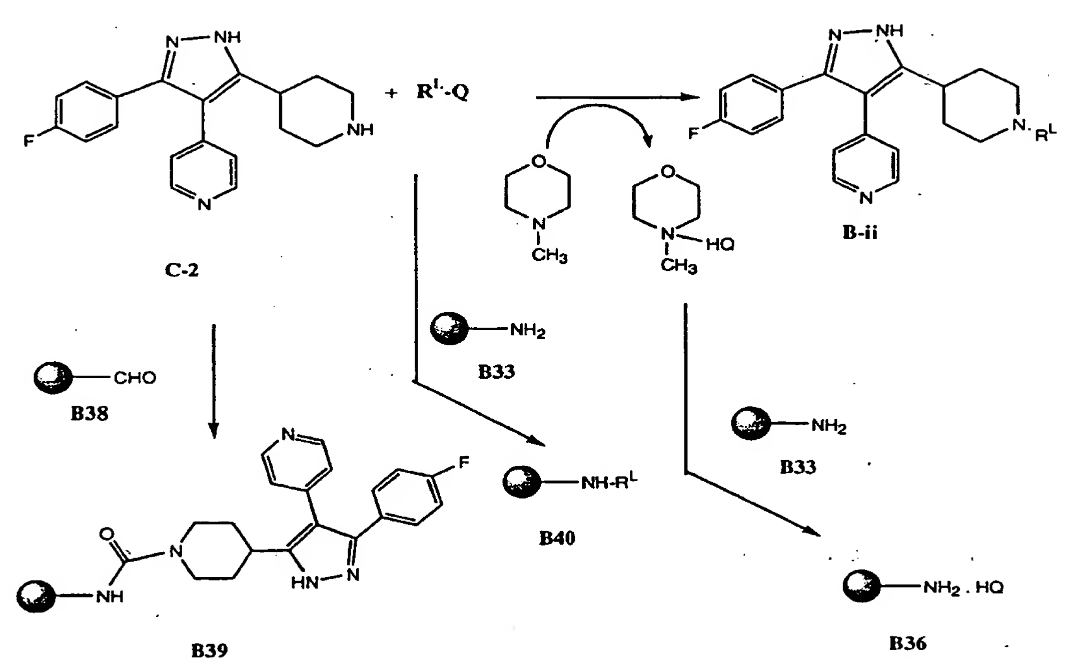
Scheme B-6



Scheme B-7 illustrates the conversion of the secondary-amine containing scaffold **C-2** to the desired products **B-ii**. In a parallel array synthesis reaction block, individual reaction products are prepared in each of 48 multiple reaction block vessels. A solution of the scaffold **C-2** (limiting amount) in dimethylformamide (DMF) is added to the reaction vessels followed by a 4.0-fold stoichiometric excess solution of N-methylmorpholine in DMF. To each reaction vessel is then added an electrophile R^L-Q as a dichloroethane (DCE) solution: either a 2.0 fold stoichiometric excess is used when R^L-Q is an acid chloride or alkyl chloroformate, or a 1.5 fold stoichiometric excess when R^L-Q is a sulfonyl chloride, or a 1.25 fold stoichiometric excess when R^L-Q is an isocyanate. The reaction mixtures are incubated at

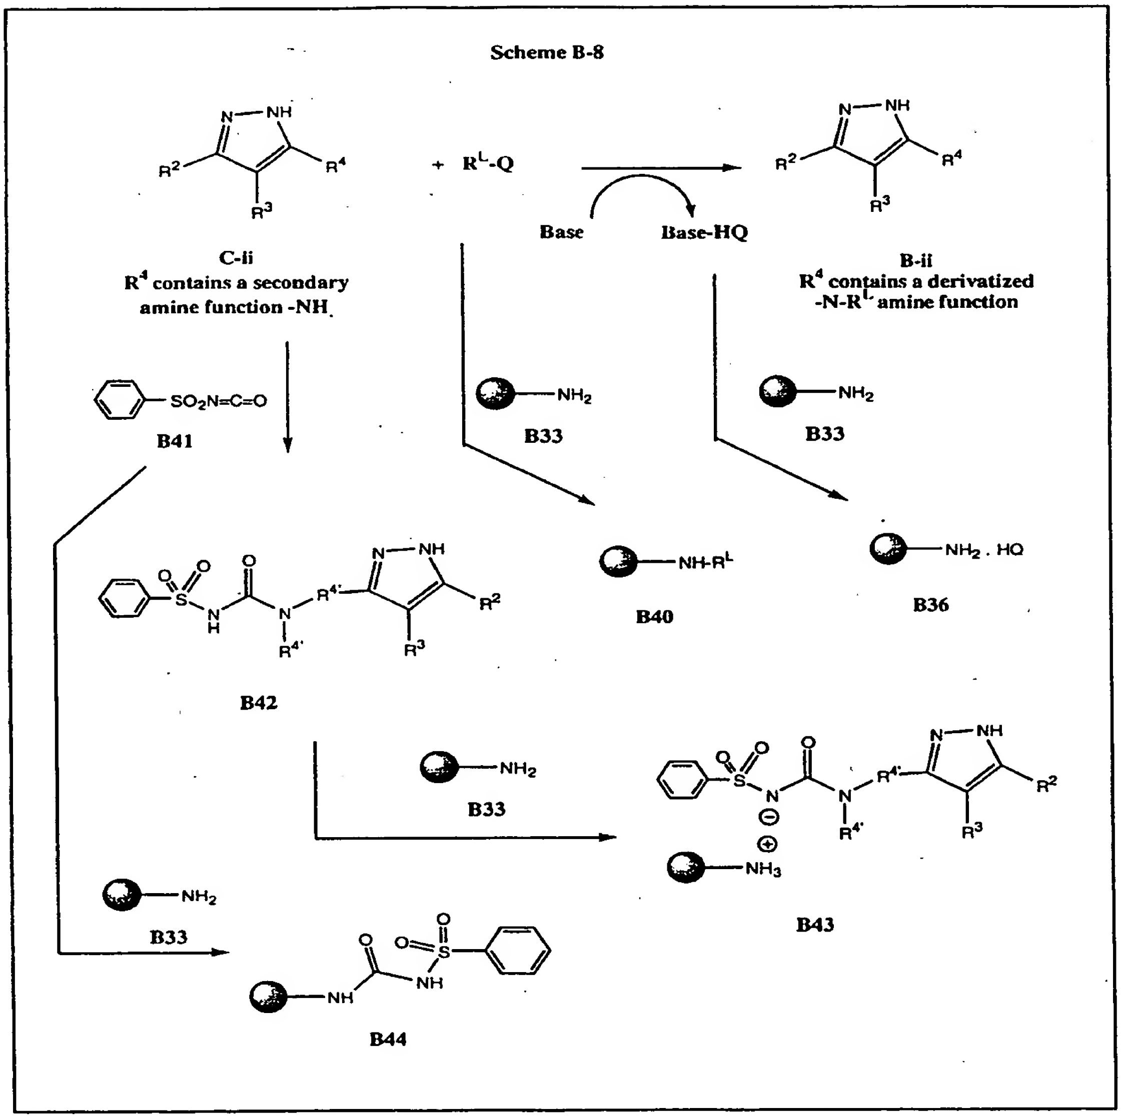
ambient temperature for 2-6 h. Each reaction vessel is then charged with a large excess (15-20 fold stoichiometric excess) of the amine-functionalized resin **B33** and the isocyanate-functionalized resin **B32**. The resin-charged reaction block is shaken vertically for 14-20 h on an orbital shaker at ambient temperature to allow optimum agitation of the resin-containing vessel mixtures. The excess electrophiles R^L-Q and unreacted scaffold amine **C-2** are removed from the reaction medium as insoluble adducts **B40** and **B39**, respectively. Resin **B33** also sequesters the HQ byproduct in each vessel as **B36**, formed by proton transfer from solution-phase Base-HQ. Incubation with these resins, followed by filtration and rinsing with solvent mixtures of DMF and/or DCE, affords purified product solutions in collection vials filtered away from resin-adducts **B33**, **B36**, **B38**, **B39**, and **B40**. Concentration of filtrates affords purified products **B-ii**.

Scheme B-7



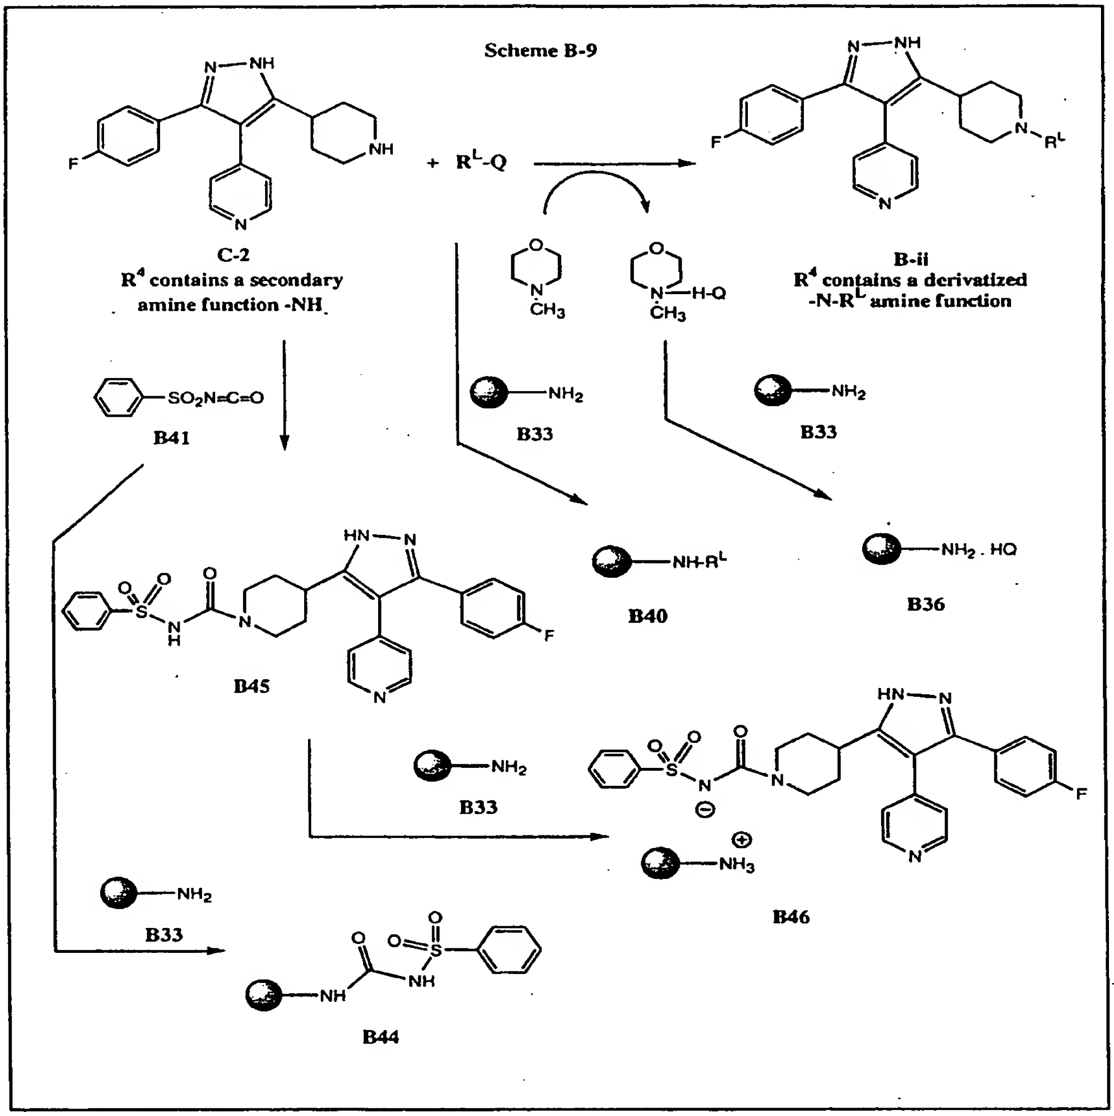
Scheme B-8 illustrates another general synthetic method involving the parallel array reaction of a scaffold **C-ii** containing a secondary amine functionality within the definition of the R^4 substituent. Each reaction vessel is charged with the secondary amine-containing scaffold **C-ii**, followed by the introduction of a stoichiometric excess of an optionally unique electrophile R^L-Q into each vessel. Reaction of scaffold **C-ii** with R^L-Q is effected in the presence of tertiary amine base at room temperature or elevated temperature in a mixture of a polar aprotic solvent and/or a halogenated solvent.

Excess electrophiles and N-methylmorpholine are used to effect more rapid and/or more complete conversion of scaffold **C-ii** to products **B-ii** compared to reactions that do not utilize stoichiometric excesses of electrophiles and N-methylmorpholine. The reaction mixtures are incubated at ambient temperature for 2-8 h. Each reaction vessel is then charged with the sequestration-enabling reagent phenylsulfonylisocyanate **B41**. This reagent **B41** reacts with remaining secondary amine scaffold **C-ii**, converting **C-ii** to the *in situ*-derivatized compound **B42**. Subsequent incubation of these vessel mixtures with a large excess (15-20 fold stoichiometric excess) of the amine-functionalized resin **B33** sequesters the solution-phase species R^L-Q, HQ, **B41**, and **B42** as the resin-bound adducts **B40**, **B36**, **B44**, and **B43**, respectively. The resin-charged reaction block is shaken vertically for 14-20 h on an orbital shaker at ambient temperature to allow optimum agitation of the resin-containing vessel mixtures. Filtration of the insoluble resin- adducts **B33**, **B36**, **B40**, **B43** and **B44** and subsequent rinsing of the vessel resin-bed with DMF and/or DCE affords filtrates containing the purified products **B-ii**. Concentration of the filtrates affords the purified products **B-ii**.



Scheme B-9 illustrates the method of Scheme B-8 using scaffold **C-2**. A solution of the scaffold **C-2** (limiting

amount) in dimethylformamide (DMF) is added to the reaction vessels followed by a 4.0-fold stoichiometric excess solution of N-methylmorpholine in DMF. To each reaction vessel is then added an electrophile R^L-Q as a dichloroethane (DCE) solution: either a 2.0 fold stoichiometric excess is used when R^L-Q is an acid chloride or alkyl chloroformate, or a 1.5 fold stoichiometric excess when R^L-Q is a sulfonyl chloride, or a 1.25 fold stoichiometric excess when R^L-Q is an isocyanate. The reaction mixtures are incubated at ambient temperature for 2-6 h. After solution-phase reactions have progressed to afford crude product mixtures, each reaction vessel is then charged with a dichloroethane solution of the sequestration-enabling reagent phenylsulfonylisocyanate **B41**. This reagent **B41** reacts with remaining secondary amine scaffold **C-2**, converting **C-2** to the *in situ*-derivatized compound **B45**. Subsequent incubation of these vessel mixtures with a large excess (15-20 fold stoichiometric excess) of the amine-functionalized resin **B33** sequesters the solution-phase species R^L-Q, HQ, **B41**, and **B45** as the resin-bound adducts **B40**, **B36**, **B44**, and **B46**, respectively. The resin-charged reaction block is shaken vertically for 20 h on an orbital shaker at ambient temperature to allow optimum agitation of the resin-containing vessel mixtures. Filtration of the insoluble resin- adducts **B33**, **B36**, **B40**, **B44**, and **B46** and subsequent rinsing of the vessel resin-bed with DCE affords filtrates containing the purified products **B-ii**. Concentration of the filtrates affords the purified products **B-ii**.



Another general method for the parallel array reaction block synthesis is illustrated in Scheme B-10 for the derivatization of the carboxylic acid-containing scaffold

C-iii. Scaffold **C-iii** with a free carboxylic acid functionality is reacted in spatially addressed, parallel array reaction block vessels with excesses of optionally different primary or secondary amines **B47** in the presence of the polymer-bound carbodiimide reagent **B48** and a tertiary amine base in a mixture of a polar aprotic solvent and/or a halogenated solvent. After filtration of each crude vessel product misture away from resins **B48** and **B49**, each reaction mixture is purified by treatment with the sequestration-enabling-reagent **B50** (*tetra*-fluorophthalic anhydride). The reagent **B50** reacts with remaining excess amine **B47** to afford the *in situ*-derivatized intermediates **B51** which contain carboxylic acid molecular recognition functionality. Subsequent incubation of each reaction mixture with a 15-20-fold stoichiometric excess of the primay amine-functonalized resin **B33** sequesters **B51**, **B50**, and any remaining acid scaffold **C-iii** as resin-bound adducts **B52**, **B53**, and **B54**, respectively. Filtration of soluton-phase products **B-iii** away from these resin-bound adducts and rinsing of the resin beds with a polar aprotic solvent and/or halogenated solvent affords filtrates containing purified products **B-iii**. Concentration of the filtrates affords purified **B-iii**.

Scheme B-11 illustrates the conversion of the acid containing scaffold **C-49** to the desired amide products **B-iii** in a parallel synthesis format. A limiting amount of the scaffold **C-49** is added as a solution in dimethylformamide to each reaction vessel containing the polymer bound carbodiimide reagent **B48** (5 fold stoichiometric excess). A solution of pyridine (4 fold stoichiometric excess) in dichloromethane is added to this slurry, followed by addition of an excess amount of a dimethylformamide solution of a unique amine **B47** (1.5 fold stoichiometric excess) to each vessel. The parallel reaction block is then agitated vertically on an orbital shaker for 16-18 h at ambient temperature and filtered to separate the solution phase product mixture away from resin-bound reagent **B48** and resin-bound reagent byproduct **B49**. The resulting solutions (filtrates) containing a mixture of the desired amide products **B-iii**, excess amines **B47** and any unreacted acid containing scaffold **C-49**, are treated with tetrafluorophthalic anhydride **B50**. **B50** converts the excess amines **B47** in each filtrate vessel to its respective sequestrable half acid form **B51**. After two h incubation time, an excess of the amine-functionalized resin **B33** and dichloromethane solvent are added to each reaction vessel. The amine-containing resin **B33** converts **B51**, any remaining **B50**, and any remaining **C-49** to their resin-bound adducts **B52**, **B53**, and **B55**, respectively. The resin-charged reaction block is shaken vertically for 16 h on an orbital shaker at ambient temperature to allow optimum agitation of the resin-containing vessel mixtures. Filtration of the insoluble resin- adducts **B33**, **B52**, **B53**, and **B55** and subsequent rinsing of the vessel resin-bed with

Although Schemes B-1 through B-11 describe the use of parallel array chemical library technology to prepare compounds of general formulae **B-i**, **B-ii**, and **B-iii**, it is noted that one with ordinary skill in the art of classical synthetic organic chemistry would be able to prepare **B-i**, **B-ii**, and **B-iii** by conventional means (one compound prepared at a time in conventional glassware and purified by conventional means such as chromatography and/or crystallization).

A general synthesis of pyridylpyrazole scaffolds **C-i**, **C-ii**, and **C-iii** is depicted in Scheme C-1.

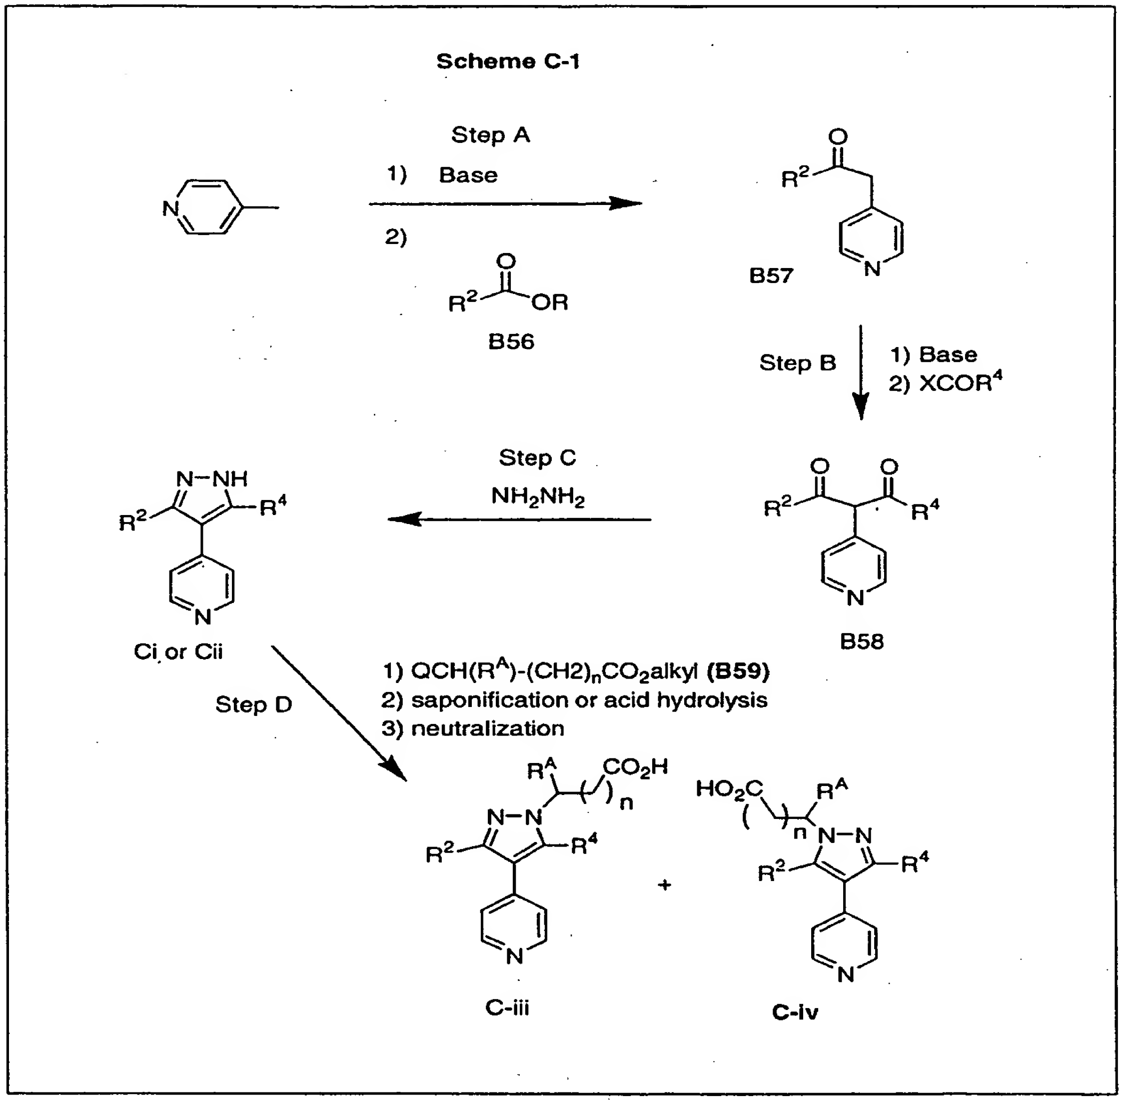
Step A: Picoline is treated with a base chosen from but not limited to n-butyllithium (n-BuLi), lithium di-*iso*-propylamide (LDA), lithium hexamethyldisilazide (LiHMDS), potassium *t*-butoxide (*t*BuOK), or sodium hydride (NaH) in an organic solvent such as tetrahydrofuran (THF), diethyl ether, *t*-butyl methyl ether, *t*-BuOH or dioxane from -78 °C to 50 °C for a period of time from 10 minutes to 3 hours. The metallated picoline solution is then added to a solution of ester **B56**. The reaction is allowed to stir from 30 minutes to 48 hours during which time the temperature may range from -20 °C to 120 °C. The mixture is then poured into water and extracted with an organic solvent. After drying and removal of solvent the pyridyl monoketone **B57** is isolated as a crude solid which can be purified by crystallization and/or chromatography.

Step B: A solution of the pyridyl monoketone **B57** in ether, THF, tBuOH, or dioxane is added to a base chosen from but not limited to n-BuLi, LDA, LiHMDS, tBuOK, or NaH contained in hexane, THF, diethyl ether, *t*-butyl methyl ether, or *t*-BuOH from -78 °C to 50 °C for a period of time from ranging from 10 minutes to 3 hours. An appropriately substituted activated ester or acid halide derived from R^4-CO_2H is then added as a solution in THF, ether, or dioxane to the monoketone anion of **B57** while the temperature is maintained between -50 °C and 50 °C. The resulting mixture is allowed to stir at the specified temperature for a period of time from 5 minutes to three hours. The resulting pyridyl diketone intermediate **B58** is utilized without purification in Step C.

Step C: The solution containing the pyridyl diketone **B58** is quenched with water and the pH is adjusted to between 4 and 8 utilizing an inorganic or organic acid chosen from HOAc, H_2SO_4, HCl, or HNO_3. The temperature during this step is maintained between -20 °C and room temperature. Hydrazine or hydrazine hydrate was then added to the mixture while maintaining the temperature between -20 °C and 40 °C for a period of 30 minutes to three hours. The mixture is then poured into water and extracted with an organic solvent. The pyridyl pyrazole **C-i** or **C-ii** is obtained as a crude solid which is purified by chromatography or crystallization.

Step: D In some cases the pyridyl pyrazole **C-i** or **C-ii** is alkylated with Q-C(R^A)-(CH2)$_n$$CO_2$alkyl wherein Q is halogen. **C-i** or **C-ii** is treated with a base chosen from NaH, NaOEt, KOtBu, or NEt_3 in an organic solvent such as THF, methylene chloride, dioxane, or DMF at temperatures

between -20 °C and 150 °C and reaction times between 30 minutes and 12 hours. The resulting alkylated pyridyl pyrazole ester is then hydrolyzed to the acid by treament with NaOH or LiOH in aqueous/alcohol solvent mixtures or in THF/water solvent mixtures. Alternatively, the ester function is removed by treatment with an organic or inorganic acid if the alkyl residue is *t*-butyl. Acidification, followed by extraction with an organic solvent affords **C-iii** which may be purified by chromatography or crystallography. In some cases, regioisomeric alkylated products **C-iv** are also formed. The desired **C-iii** can be separated away from **C-iv** by chromatographic purification or by fractional crystallization.



A synthesis of pyridylpyrazole scaffold **C-1** is depicted in Scheme C-2.

Step A:

Picoline is added to a solution of LiHMDS in THF at room temperature over a time period ranging from 30 minutes to 1 hour. The resulting solution is stirred for an additional 30 minutes to 1 hour at room temperature. This solution is then added to neat ethyl p-fluorobenzoate **B60** at room temperature over 1-2 h. The mixture is then allowed to stir at room temperature for 16-24 h. Equal portions of water and ethyl acetate are then added to the reaction and the mixture is partitioned in an extraction funnel. The organic layer is dried, filtered, and evaporated to give an oily solid. Hexanes are then added and the solid is filtered and washed with cold hexanes leaving the pyridyl monoketone **B61** for use in Step B.

Step B:

The pyridyl monoketone **B61** is added as a solution in THF to a flask maintained at room temperature which contains *t*-BuOK in a THF/ *t*-BuOH cosolvent. A yellow precipitate forms and stirring at room temperature is continued for 1-3 h. After this time, N-Cbz-protected glycine N-hydroxysuccinimide **B62** is added dropwise at room temperature as a solution in THF over 1-3 h. This solution, containing crude diketone **B63**, is used directly in Step C.

Step C:. The solution from step C is treated with water and the pH is adjusted to between 6 and 7 with acetic acid. Hydrazine hydrate is then added dropwise to the mixture as a solution in water over 30 minutes to 1h at room temperature. Water and ethyl acetate are then added to the flask and the mixture is then partitioned in a separatory funnel. The organic layer is dried, filtered, and evaported to give a crude oil which is purified by

silica gel chromatography, giving rise to purified **C-1Cbz**.

Step: D

The Cbz protecting group contained in compound **C-1Cbz** is cleaved using hydrogen gas under pressure and Pd-C in methanol solvent. The resulting amine **C-1** is obtained by filtration and concentration.

A number of pyridyl pyrazole scaffolds of type **C-v** are prepared as shown in Scheme C-3.

Step A: Picoline is treated with a base chosen from but not limited to *n*-BuLi, LDA, LiHMDS, *t*BuOK, or NaH in an organic solvent such as THF, ether, *t*-BuOH or dioxane from −78 °C to 50 °C for a period of time from 10 minutes to 3 hours. The metallated picoline solution is then added to a solution of an appropriately activated ester analog of a carboxylic acid $CbzNR^H-(CH_2)_nCR^F(R^G)-CO_2H$ or $BocNR^H-(CH_2)_nCR^F(R^G)-CO_2H$, preferably but not limited to the N-hydroxysuccinimide **B64**. The reaction is allowed to stir from 30 minutes to 48 hours during which time the temperature may range from −20 °C to 120 °C. The mixture is then poured into water and extracted with an organic solvent. After drying and removal of solvent the pyridyl monoketone **B65** is isolated as a crude solid which can be purified by crystallization and/or chromatography.

Step B: A solution of the pyridyl monoketone **B65** in ether, THF, tBuOH, or dioxane is added to a base chosen from but not limited to *n*-BuLi, LDA, LiHMDS, *t*BuOK, or NaH contained in hexane, THF, ether, dioxane, or *t*BuOH from −78 °C to 50 °C for a period of time from 10 minutes to 3 hours. The anion sometimes precipitates as a yellow solid. An appropriately substituted activated ester such as the N-hydroxysuccinimide **B66** is then added as a solution in THF, ether, or dioxane to the monoketone anion while the temperature is maintained between -50 °C and 50 °C. The resulting mixture is allowed to stir at the specified temperature for a period of time from ranging from 5 minutes to 3 hours. The resulting pyridyl diketone intermediate **B67** is utilized without further purification in Step C.

Step C: The solution containing the pyridyl diketone **B67** is quenched with water and the pH is adjusted to between 4 and 8 utilizing an inorganic or organic acid chosen from HOAc, H_2SO_4, HCl, or HNO_3. The temperature during this step is maintained between -20 °C and room temperature. Hydrazine or hydrazine hydrate is then added to the mixture while maintaining the temperature between -20 °C and 40 °C for a period of 30 minutes to three hours. The mixture is then poured into water and extracted with an organic solvent. The pyridyl pyrazole **C-vBoc** or **C-vCbz** is obtained as a crude solid which is purified by chromatography or crystallization.

Step: D

The carbamate protecting groups from **C-vBoc** or **C-vCbz** are removed to afford the scaffolds **C-v** containing either a free primary amine (R^H is hydrogen) or a free secondary amine (R^H not equal to hydrogen). The Boc protecting carbamate groups are cleaved utilizing 1:1 trifluoroacetic acid (TFA)/methylene chloride at room temperature for several hours. The CBZ carbamate protecting groups are cleaved using hydrogen gas under pressure and Pd-C in an alcoholic solvent. The resulting amines **C-v** are then optionally crystallized or purified by chromatography.

The synthesis of scaffolds **C-vi** is accomplished as shown in Scheme C-4.

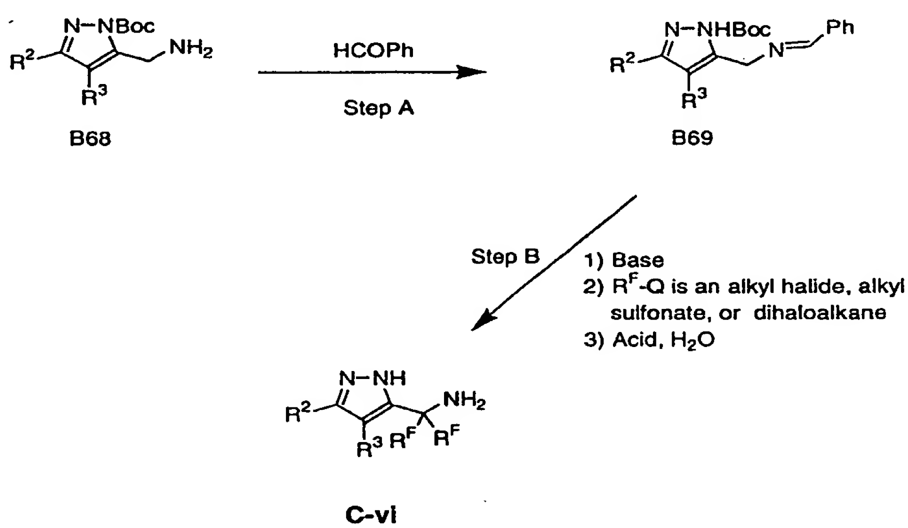
Step A:

A Boc protected pyridylpyrazole **B68** is treated with benzaldehyde in methylene chloride at room temperature in the presence of a drying agent for a period of time ranging from 1-24 h. Solvent is then evaporated and the resulting imine **B69** is used in step B without further purification.

Step B:

The pyridylpyrazole imine **B69** is dissolved in THF and stirred under nitrogen at temperatures ranging from -78 to -20 °C. A base such as LDA, *n*-BuLi, or LiHMDS is added dropwise to the mixture which is then stirred for an additional 10 minutes to 3 h. Two-five equivalents of an alklyating agent R^F-Q are then added to the mixture and stirring is continued for several hours. The mixture is then quenched with acid and allowed to warm to room temperature and stirred several hours until cleavage of the Boc and the imine functions is complete. The pH is adjusted to 12 and then the mixture is extracted with an organic solvent, which is dried and evaporated. The crude pyridylpyrazole is then crystallized and/or chromatographed to give **C-vi**.

Scheme C-4

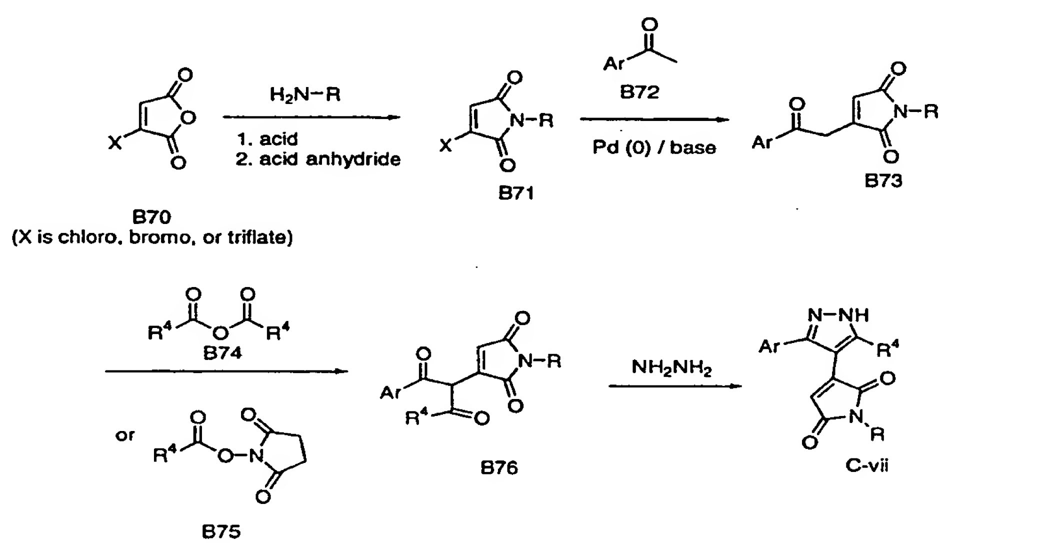


The synthesis of maleimide-containing scaffolds **C-vii** is accomplished as shown in Scheme C-5.

The maleimide pyrazole scaffolds **C-vii** are synthesized as depicted in scheme C-5. Condensation reaction of a primary amine H_2N-R with a maleic anhydride **B70** that is substituted at position 3 with either a bromo, chloro, or triflate group generates compound **B71**. The formed maleimide derivative **B71** then reacts with an acetophenone derivative **B72** in the presence of a Pd(0)

catalyst and base to afford compound **B73**. The methylene position of **B73** is then acylated with an acid anhydride **B74** or an activated acid ester **B75**, forming the di-ketone derivative **B76** . The di-ketone **B76** condenses with hydrazine to afford the desired maleimide pyrazole scaffold **C-vii**.

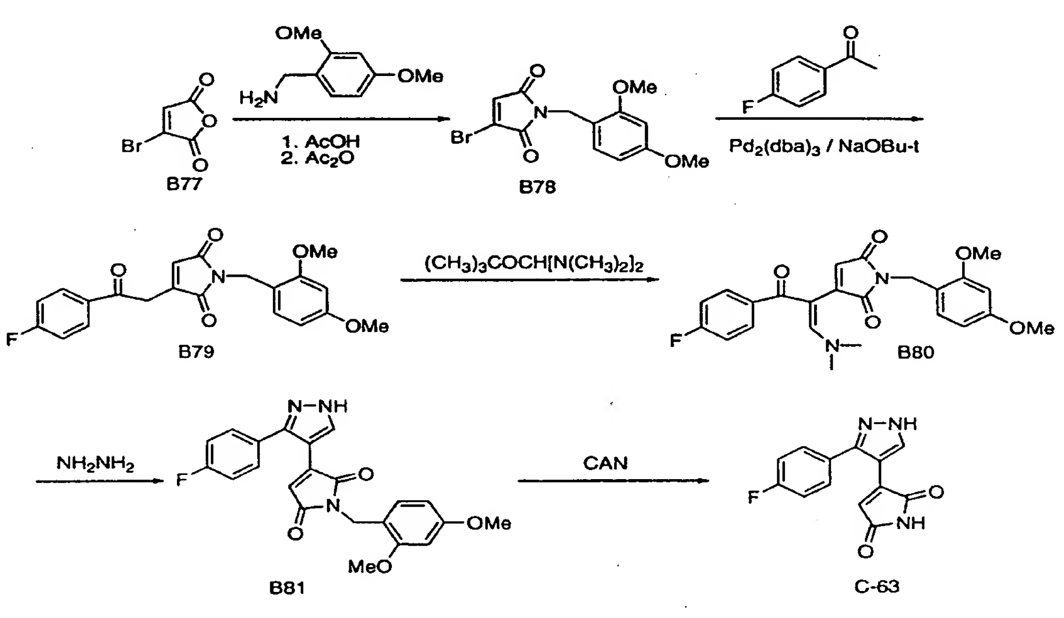
Scheme C-5



Scheme C-6 illustrates the synthesis of the maleimide pyrazole scaffold **C-63** wherein R^4 is hydrogen. The synthesis starts with the condensation reaction of bromomaleic anhydride **B77** with 2, 4-dimethoxybenzylamine in acetic acid and acetic anhydride, giving rise to intermediate **B78**. The maleimide **B78** is then treated with 4'-fluoroacetophenone in the presence of catalytic amount

$Pd_2(dba)_3$ and sodium *t*-butoxide to form the fluoroacetophenone substituted maleimide **B79**. The **B79** is treated with *tert*-butoxybis(dimethylamino)methane to yield the a-ketoenamine **B80**. The a-ketoenamine **B80** is condensed with hydrazine to form the maleimide pyrazole skeleton **B81**. The 2, 4-dimethoxybenzyl group protecting group is optionally removed with ceric ammonium nitrate (CAN) to give compound **C-63**.

Scheme C-6



Scheme C-7 illustrates the synthesis of maleimide-containing scaffolds **C-64** and **C-65**. These scaffolds **C-49** and **C-50** are synthesized according to the general methods

illustrated in Scheme C-5 and exemplified with the utilization of N-hydroxysuccinimides **B82** and **B83** to afford the maleimide-containing pyrazoles **B86** and **B87**, respectively. Optional removal of the 2,4-dimethoxylbenzyl groups with CAN and subsequent removal of the Boc-protecting groups with trifluoroacetic acid (TFA) affords the scaffolds **C-64** and **C-65**.

Experimental procedure for the parallel synthesis of a series of amides, carbamates, ureas and sulfonamides B-0001 through B-0048 from scaffold C-1.

Examples B-0001 through B-0048

To each reaction vessel (polypropylene syringe tubes fitted with a porous frit, closed at the bottom) of a parallel reaction apparatus was added 200 uL of dimethylformamide. A stock solution of the scaffold amine **C-1** in dimethylformamide (0.1 M, 500 uL) was added to each reaction vessel followed by the addition of a stock solution of N-methylmorpholine in dimethylformamide (1.0 M., 200 uL). A stock solution of each of the electrophiles was then added to the appropriate reaction vessels: a) 500 uL of a 0.2 M solution of the acid chlorides in dichloroethane or b) 500 uL of a 0.2 M solution of the chloroformates in dichloroethane or c) 313 uL of a 0.2 M solution of the isocyanates in dichloroethane or d) 375 uL of a 0.2 M solution of the sulfonyl chlorides in dichloroethane. The parallel reaction apparatus was then orbitally shaken (Labline Benchtop orbital shaker) at 200 RPM at ambient

temperature (23-30 °C) for a period of 2-3 h, under a gentle flow of nitrogen. At this time each reaction vessel was treated with approximately 250 mg of polyamine resin **B33** (4.0 meq N/g resin) and approximately 100 mg of polyaldehyde resin **B32** (2.9 mmol/g resin). Each reaction vessel was diluted with 1 mL dimethylformamide and 1 mL dichloroethane and the orbital shaking was continued at 200 RPM for a period of 14-20 h at ambient temperature. Each reaction vessel was then opened and the desired solution phase products separated from the insoluble quenched byproducts by filtration and collected in individual conical vials. Each vessel was rinsed twice with dichloroethane (1 mL) and the rinsings were also collected. The solutions obtained were then evaporated to dryness in a Savant apparatus (an ultracentrifuge equipped with high vacuum, scalable temperature settings and a solvent trap to condense the volatile solvent vapors). The resulting amide, carbamate, urea and sulfonamide products were then weighed and characterized. The yields and analytical data for the products obtained using this method are shown below.
